To avoid the loss of a flight plan, the flight crew must copy the SEC 3 flight plan in SEC 1 or SEC 2 before uploading the ATC flight plan.

FREETEXT BUTTON

When clicked, enables the flight crew to add freetext to a NEGATIVE or UNABLE response.

Ident.: DSC-46-ATC-20-60-10-00000905.0001001 / 04 DEC 14

INFORMATION MESSAGES AREA

L12

Information displayed	Conditions for display	Conditions for display removal
ANSWER MSG	A file of uplink messages to be answered is full.	File no longer full.
ATC DLK FAULT	ATC communication function failed.	ATC communication function available.
ATC DLK NOT AVAIL	ATC communication function temporarily not available.	ATC communication function available.
ATCCOM FOR MODIF	Following a click on the MODIFY button.	Sending requested; modified text displayed in the mailbox.
CHECK CLRCE	Response lost for a positive reminder of a deferred clearance.	
FILE FULL	A file of 'not ready to be closed' downlink messages generated by the flight crew is full.	File no longer full.
FMS MONITORING	Monitoring in progress.	Monitoring result obtained or timed out.
LINK LOST	"Abnormal" loss of data link connection.	
LOAD NOT AVAIL	Loading not possible, even if the loading was in progress.	Other loading requested.
LOAD PARTIAL	Partial loading.	Other loading requested.
LOAD REJECTED	Loading failed due to the content of the data proposed.	Other loading requested.
LOADED IN SEC3	Successful loading.	Other loading requested.
LOADING	Loading requested and in progress.	Load result obtained or timed out.
MONIT CANCELLED	Monitoring canceled.	Other monitoring requested.
MONIT FAILED	Monitoring requested and failed.	Other monitoring requested or monitoring no longer required.
MONIT LOST	Loss of monitoring. May appear following a change of ATC center, if there is a change from FANS A to FANS B, and the new ATC center does not support a request for condition monitoring that the previous ATC center made.	Other monitoring requested or monitoring no longer required.
MONIT NOT AVAIL	Monitoring impossible because of system unavailability.	Other monitoring requested or monitoring no longer required.

Continued on the following page

Continued from the previous page

Information displayed	Conditions for display	Conditions for display removal
NO SYS DATA	An aircraft system data (e.g. FMS data) is not available.	Other data requested or XFR TO MAILBOX command.
OVERFLW CLOSED	A file of 'ready to be closed' messages is full and a new message of this category is stored in the file.	
PARTIAL SYS DATA	An aircraft system (e.g. FMS) data is not available for all requests.	Other data requested.
PRINT FAILED	Print requested from the mailbox and print failed.	New information that belongs to the same category asks for display, or 10 s after the print request.
PRINT NOT AVAIL	Print requested from the mailbox while printer not available.	New information that belongs to the same category asks for display, or 10 s after the print request.
PRINTING	Print requested from the mailbox and print in progress.	New information asks for display, or 10 s after the print request.
RECEIVED BY ATC	Message received by the ATC center.	
REJ BY ATC	Error message received following a request. The ATC center did not receive the initial message.	
REPLY WITHIN XXS	In some cases, a countdown of 30 s is activated and displayed. The flight crew has XX seconds to answer an incoming message.	Response timed out or response sent.
REPLY: TIME OUT	No answer to a request, and operational timer expired.	The message can only be closed and the flight crew must revert to voice communication.
SEND FAILED	Appears if: - The transmission of a reply to an uplink message or downlink message failed, or - A negative acknowledgement was received, or - No acknowledgement from the ground was received within 6 min with FANS A or 40 s with FANS B.	
SENDING	The flight crew clicked the SEND button.	Sending result obtained (positive or negative) or timed out.
SENT	Appears when: - An acknowledgement from the ground was received, or - The associated uplink message in response of a downlink message was received.	

Continued on the following page

Continued from the previous page

Information displayed	Conditions for display	Conditions for display removal
WAIT FOR SYS DATA	Data expected from an aircraft system (e.g. FMS) before sending a message.	Data request result obtained or timed out.
X MONITORED MSG	At least one message is monitored. X is replaced by the number of monitored messages.	No monitored message.

Ident.: DSC-46-ATC-20-60-10-00020429.0001001 / 23 APR 14

SYSTEM MESSAGES

For these messages, only the CLOSE button is available on the mailbox.

ATC DATALINK COM - NOT AVAIL	The communication functions of the ATC Datalink System are no longer available.
ATC DISCONNECTED: XXXXXXXX	The CPDLC connection is lost with the indicated ATC center. When the notification becomes available, the NOTIFICATION AVAIL message appears.
MSG RECORD LOST	Messages can no longer be recorded.
NOTIFICATION FAILED - WITH XXXXXXXX	The notification procedure failed with the indicated ATC center.
CONTACT ATC BY VOICE - DEPARTURE(OCEANIC) CLEARANCE NOT YET CONFIRMED BY ATC	Answer from the ATC center was not received in due time, following a departure(oceanic) clearance request. The flight crew must contact the ATC center by voice.
CONTACT ATC BY VOICE - DEPARTURE(OCEANIC) MESSAGE REJECTED - CLEARANCE FILE FULL	The maximum storage capacity of the mailbox is reached for A623 messages. The departure(oceanic) message from the ground is automatically rejected. The flight crew must contact the ATC center by voice.

ATC COM MESSAGES AREA

Applicable to: ALL

Ident.: DSC-46-ATC-20-40-10-00000641.0001001 / 23 APR 14

The ATC COM message area displays messages on two lines of 33 characters.
In order to clear a message, the flight crew must click on the CLEAR INFO button or press the CLR INFO key on the KCCU.

Ident.: DSC-46-ATC-20-40-10-00000644.0001001 / 23 APR 14

CANCEL AUTO UPDATE FIRST	Appears when the flight crew tries to modify the airport entry list or the ATIS type list, while an auto update contract is active (i.e. the request is ‘in progress’ state because no request to cancel the automatic update was sent to the ground).

Ident.: DSC-46-ATC-20-40-10-00009739.0001001 / 23 APR 14

COM DATALINK NOT AVAIL	Appears if the flight crew performs an action on the mailbox or ATC COM pages while there is no communication source available for datalink.

Ident.: DSC-46-ATC-20-40-10-00000643.0001001 / 23 APR 14

D-ATIS GROUND MSG	Appears when a non-predefined ATIS FSM message is received.

Ident.: DSC-46-ATC-20-40-10-00000635.0001001 / 23 APR 14

D-ATIS NO REPLY	Appears when the time-out (7.5 min) is reached and that no ATIS was received.

Ident.: DSC-46-ATC-20-40-10-00000655.0001001 / 23 APR 14

D-ATIS RECEIVED	Appears when a new ATIS message is received and the D-ATIS/RECEIVED page is displayed.

Ident.: DSC-46-ATC-20-40-10-00000632.0001001 / 23 APR 14

D-ATIS SEND FAIL	Appears when an ATIS request failed for one of the following reasons: - The sending of the ATIS request failed, or - The time-out (6 min) for acknowledgement is reached, or - A negative answer for the ATIS request is received.

Ident.: DSC-46-ATC-20-40-10-00000581.0001001 / 04 DEC 14

D-ATIS UPDATED - READ AGAIN	Appears when a new ATIS is received while the MFD displays the PREVIOUS or LAST tab of the D-ATIS/RECEIVED page.

Ident.: DSC-46-ATC-20-40-10-00000642.0001001 / 04 DEC 14

D-ATIS USED OFFSIDE	Appears when the MFD of a flight crewmember displays the D-ATIS/RECEIVED page, while the other flight crewmember modifies the AIRPORT entry field or the ATIS type list on the D-ATIS/LIST page of their MFD.

Ident.: DSC-46-ATC-20-40-10-00011292.0001001 / 23 APR 14

ENTER OR CHECK FLT NUMBER - IN FMS INIT PAGE	Appears when the flight crew requests a departure or oceanic clearance while the flight number is not available or not valid.

Ident.: DSC-46-ATC-20-40-10-00000646.0001001 / 23 APR 14

ENTRY OUT OF RANGE	Appears on the first line, if the value that the flight crew entered is outside the correct range.

The correct range, as defined below, appears on the second line:

Type of data	Out Of Range Messages
Altitude	
Beacon code	RNG: 0000 TO 7777
Distance	RNG: 1 TO 999.9 NM OR 1 TO 1024KM
Flight level	RNG: FL30 TO FL450
Frequency	
Ground speed	RNG: 100 TO 700 KT
Heading or track	RNG: 0 TO 360°
Latency	RNG: 1 TO 999 S
Mach	RNG: M.61 TO M.92
Offset	RNG: 1 TO 128 NM
Position	
Position or time	
Remaining fuel	RNG: 0H00MIN TO 23H59MIN
Remaining souls	RNG: 1 TO 1024
Speed	RNG: 100 TO 350 KT
Temperature	RNG: –80 TO 47 C
Time	RNG: 0000Z TO 2359Z
Vertical speed	RNG: –6000 TO 6000 FT/MIN
Weather Deviation	RNG: 1 TO 128 NM

Continued on the following page

Continued from the previous page

Type of data	Out Of Range Messages
Wind heading	RNG: 1 TO 360°
Wind speed	RNG: 0 TO 255 KT

Position	FORMAT: WPT OR LAT/LONG OR PBD
Position (A623)	FORMAT: WPT OR LAT/LONG
Position or time	FORMAT: POS XXXXX OR UTC HHMMZ
Procedure	FORMAT: XXXXXX
Remaining fuel	FORMAT: HHMM
Remaining souls	FORMAT: XXX
Speed	FORMAT: FOR CAS XXX FOR MACH .XX
Temperature	FORMAT: +/-XXC OR F
Time	FORMAT: HHMMZ
Vertical speed	FORMAT: +/-XXXXFT/MIN OR M/MIN
Weather deviation	FORMAT: XXX L OR R OR LR
Wind heading	FORMAT: XXX°
Wind speed	FORMAT: XXXKT OR KM/H

Ident.: DSC-46-ATC-20-40-10-00000649.0001001 / 04 DEC 14

IDENTICAL D-ATIS REQUEST	Appears when the flight crew enters the same airport code, and the same ATIS type in two different ATIS request areas.

Ident.: DSC-46-ATC-20-40-10-00000650.0001001 / 23 APR 14

LAST MSG ELEMENT	Appears when: - There are 5 frames on the REQUEST page, or - There is a DEPARTURE or OCEANIC frame on the REQUEST page, or - There are 5 frames on the OTHER REPORTS page, or - There are 5 frames on the EMERGENCY page.

Ident.: DSC-46-ATC-20-40-10-00000651.0001001 / 23 APR 14

MAILBOX FULL - SEND OR CANCEL SOME MSG	Appears when the flight crew clicks on any XFR TO MAILBOX button while the mailbox messages file is full.

Ident.: DSC-46-ATC-20-40-10-00000480.0001001 / 04 DEC 14

MSG ABORTED — ACTIVE ATC DISCONNECTED	Appears if there is a CPDLC connection loss that is not expected while the flight crew is processing a message for the ATC center.

Ident.: DSC-46-ATC-20-40-10-00009738.0001001 / 23 APR 14

L12

MSG ABORTED — NOT SUPPORTED BY CURRENT ATC	Appears when there is a change of ATC center while the flight crew prepares a message that the new ATC center cannot process. This occurs when there is a transition from FANS A to FANS B due to a change of ATC center.

Ident.: DSC-46-ATC-20-40-10-00000652.0001001 / 23 APR 14

MSG RECORD LOST	Appears when there is a storage problem while the MSG RECORD page is displayed.

Ident.: DSC-46-ATC-20-40-10-00000654.0001001 / 23 APR 14

MSG RECORD USED OFFSIDE	Appears when the MFD of a flight crewmember displays the MSG RECORD/LIST page, and the other flight cewmember clicks on the ERASE ALL button of the MSG RECORD/LIST page of their MFD.

Ident.: DSC-46-ATC-20-40-10-00000584.0001001 / 04 DEC 14

NEW D-ATIS GROUND MSG - READ AGAIN	Appears when a non-predefined ATIS FSM message is received while the MFD displays the D-ATIS/GND SYS MSG page.

Ident.: DSC-46-ATC-20-40-10-00000656.0001001 / 23 APR 14

NO SYS DATA	Appears when the flight crew clicks on the REFRESH DATA button, or the AUTO POSITION REPORT button of the AUTO & MANUAL POSITION page, while FMS and SURV data are not available.

Ident.: DSC-46-ATC-20-40-10-00000647.0001001 / 23 APR 14

NOTIFICATION NOT AVAIL - ACFT POSITION NOT AVAIL	Appears when the flight crew clicks on the NOTIFY button of the CONNECT page while the aircraft position is not available.

Ident.: DSC-46-ATC-20-40-10-00000645.0001001 / 23 APR 14

NOTIFICATION NOT AVAIL - CHECK FLT NBR IN FMS INIT PAGE	Appears when the flight crew clicks on any XFR TO MAILBOX button, or clicks on the NOTIFY button of the CONNECT page, while the flight number is not available or not valid.

Ident.: DSC-46-ATC-20-40-10-00000596.0001001 / 23 APR 14

NOTIFICATION NOT AVAIL - CHECK FROM/TO IN FMS INIT PAGE	Appears when the flight crew clicks on any XFR TO MAILBOX button, or clicks on the NOTIFY button of the CONNECT page, while the departure and destination airports are not available or not valid.

Ident.: DSC-46-ATC-20-40-10-00000583.0001001 / 23 APR 14

NOTIFICATION NOT AVAIL - WITH THIS ATC CENTER	Appears if the flight crew entered an ATC center which is neither designated as FANS B ATC center, nor a FANS A ATC center.

Ident.: DSC-46-ATC-20-40-10-00000658.0001001 / 04 DEC 14

PLEASE WAIT : UPDATE IN PROGRESS	Appears when the flight crew modifies the AIRPORT entry field or the ATIS type list of the D-ATIS/LIST page, and: - An ATIS request is in “waiting” state, or - An auto update request contract is active and a previous ATIS cancel auto update request was sent to the ground.

Ident.: DSC-46-ATC-20-40-10-00000659.0001001 / 23 APR 14

PRINTER NOT AVAIL	Appears when the flight crew clicks on the auto print button of the D-ATIS page while the printer is not available.

Ident.: DSC-46-ATC-20-40-10-00001326.0001001 / 23 APR 14

PRINTING	Appears when the ATC Datalink system prints any report or message.

Ident.: DSC-46-ATC-20-40-10-00000660.0001001 / 23 APR 14

SENDING MAYDAY WILL SWITCH ADS-C TO EMERGENCY	Appears as soon as the flight crew clicks on the MAYDAY button of the EMERGENCY page.

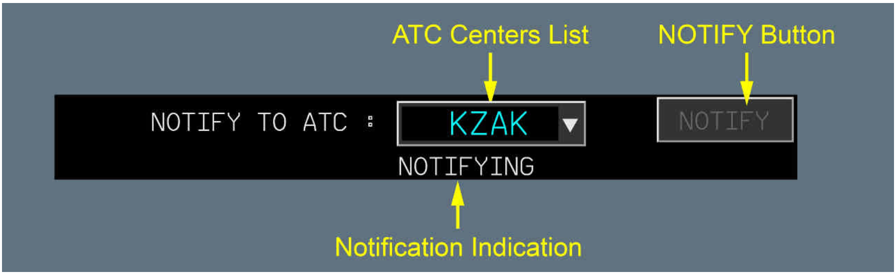
ATC CENTER NOTIFICATION

ATC Center Notification



ATC CENTERS LIST

L13

Indicates the ATC center to be notified, usually in an ICAO code. The flight crew can manually enter the ICAO code or choose the ATC center from the list.

Note: *When a CPDLC connection is active, the corresponding ATC center no longer appears in the list.*

NOTIFY BUTTON

When clicked, sends a notification to the ATC center entered in the ATC center list.

NOTIFICATION INDICATION

NOTIFYING	The flight crew sends a notification to the ATC center, and an answer is expected. The notification process is in progress.
NOTIFIED TO KZAK AT 1613Z	Indicates the ICAO code of the notified ATC center and the notification time. *Note:* *The notified center name and notification time disappear when the ATC center connects and becomes active.*
NOTIF UNAVAIL: CHECK FLT NBR	Appears when the flight crew clicks on the NOTIFY button, while the flight number is not available or not valid.

NOTIF UNAVAIL: CHECK FROM/TO	Appears when the flight crew clicks on the NOTIFY button, while the departure and destination airports are not available or not valid.
NOTIF UNAVAIL: ACFT POS UNAVAIL	Appears when the flight crew clicks on the NOTIFY button, while the aircraft position is not available.
NOTIF UNAVAIL: WITH THIS ATC	Appears if the flight crew entered an ATC center that is neither designated as a FANS B ATC center, nor a FANS A ATC center.
NOTIFICATION FAILED	The notification process failed.

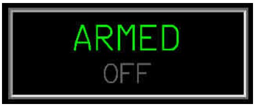
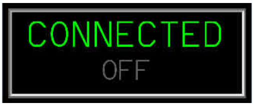
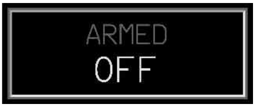
ADS-C BUTTON



Indicates that the ADS-C is armed and expects a connection from an ATC center.
This is the default state.
When clicked, the ADS-C goes OFF.



Indicates that the ADS-C is connected to at least one ATC center.
When clicked, the ADS-C goes OFF and all connected ATC centers are disconnected.

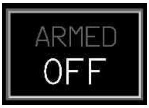


Indicates that the ADS-C is OFF. No ATC center can connect.
When clicked, the ADS-C arms.

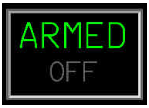
ADS-C EMERGENCY BUTTON

When no ATC center is connected, the ADS-C EMERGENCY button is OFF or ARMED.
When at least one ATC center is connected, the ADS-C EMERGENCY button is OFF or ON.

When no ATC center is connected

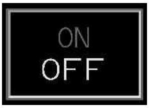


Indicates that the ADS-C Emergency is OFF.
This is the default state.
When clicked, the ADS-C Emergency status changes to ARMED. If the ADS-C was OFF, it automatically changes to ARMED.

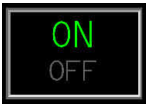


Indicates that the ADS-C Emergency is ARMED.
The status of the ADS-C Emergency automatically changes to ON as soon as there is an ADS-C connection to an ATC center.
When clicked, the ADS-C Emergency status changes to OFF.

When at least one ATC center is connected



Indicates that the ADS-C Emergency is OFF.
This is the default state.
When clicked, the ADS-C Emergency status changes to ON.



Indicates that the ADS-C Emergency is ON.
When clicked, the ADS-C Emergency status changes to OFF.

VERTICAL BUTTON

When the flight crew clicks on the VERTICAL button, they have access to the following frames:

- CLIMB TO
  The flight crew requests a climb to a higher altitude or flight level, at a specific position or time. The position or time information is optional.
  L2 CLIMB TO cannot be selected at the same time as DESCEND TO.
  The selection of a CLIMB TO after a DESCEND TO selection erases the previous selection.
- L1 DESCEND TO
  The flight crew requests a descent to a lower altitude or flight level, at a specific position or time. The position or time information is optional.
  L2 DESCEND TO cannot be selected at the same time as CLIMB TO.
  The selection of a DESCEND TO after a CLIMB TO selection erases the previous selection.
- L1 ALT/FL
  The flight crew requests a specific altitude or flight level.
- BLOCK ALT/FL
  The flight crew requests an altitude or a flight level within a specific range.
  L2 Both altitudes are required.

L1 - CRUISE CLIMB
The flight crew requests a cruise climb to a specific altitude or flight level.
- ITP [For aircraft equipped with ADS-B TRAFFIC ⊲].
When the flight crew clicks on the ITP button, the message PREPARE ITP REQUEST - IN SURV / TRAFFIC / ITP PAGE appears in the middle of the page. This is a reminder for the flight crew to use the SURV/TRAFFIC page of the MFD for an In Trail Procedure (ITP) request.

L2 This frame cannot be selected with other frames. When selected, the ITP frame appears and all other frames disappear. In addition, when the ITP frame is selected, and if the flight crew selects another frame, the ITP frame disappears.

Ident.: DSC-46-ATC-20-30-30-10-00019596.0001001 / 04 DEC 14

LATERAL BUTTON

When the flight crew clicks the LATERAL button, they have access to the following frames:
- DIRECT TO
The flight crew requests a direct route to a specific waypoint.
- OFFSET
The flight crew requests an offset from the initial route.

L2 The offset is defined with a distance and a direction. The offset starts at a specified point on the route. The definition of the starting point is optional.

L1 - WX DEVIATION
The flight crew requests an offset from the initial route due to weather conditions.

L2 The offset is defined with a distance and a direction.

L1 - HEADING
The flight crew requests a heading change.
- TRACK
The flight crew requests a track change.
- SID/STAR
The flight crew requests a Standard Instrument Departure (SID) procedure or a Standard Terminal Arrival Route (STAR) procedure, in accordance with the current flight phase.

L2 With the aircraft on ground, the request is made for an SID procedure.
With the aircraft in-flight, the request is made for a STAR procedure.

L1
- TAILORED ARRIVAL
  The flight crew requests a tailored arrival procedure.
- REROUTING.
  When the flight crew clicks on the REROUTING button, the message PREPARE NEW ROUTE IN SEC F-PLN - USE SEC INDEX FOR REQUEST appears in the middle of the page. This is a reminder for the flight crew to use the FMS for lateral rerouting.

L2
  For more information, *Refer to DSC-22-FMS-10-40-90 ATC F-PLN Clearance Request*.
  This frame cannot be selected with other frames. When selected, the REROUTING frame appears and all other frames disappear. In addition, when the REROUTING frame is selected, and if the flight crew selects another frame, the REROUTING frame disappears.

Ident.: DSC-46-ATC-20-30-30-10-00019597.0001001 / 23 APR 14

SPEED BUTTON

When the flight crew clicks the SPEED button, they have access to the following frames:
- SPEED
  The flight crew requests a specific speed.
- SPEED RANGE.
  The flight crew requests a speed within a specific range.

Ident.: DSC-46-ATC-20-30-30-10-00019598.0001001 / 23 APR 14

CLEARANCE BUTTON

When the flight crew clicks the CLEARANCE button, they have access to the following frames:

- DEPARTURE
  A request for a departure clearance is sent to the departure airport entered in the FMS or directly entered in the REQUEST page.
  L2 The message is sent via A623 to the departure airport.

  The following fields may be automatically completed, when the information becomes available:
  - Departure airport
  - Destination airport
  - Aircraft type
  - ATIS code.

  The flight crew may manually complete the following fields:
  - Gate
  - Relevant additional information (freetext).
- L1 OCEANIC
  A request for an oceanic clearance is sent to the oceanic ATC center that the flight crew entered.
  L2 The message is sent via A623 to the oceanic ATC center.

  The flight crew may manually complete the following fields:
  - Oceanic ATC center
  - Entry point
  - ETA
  - Mach
  - Level
  - Relevant additional information (freetext).
- L1 GENERIC.
  The flight crew sends a clearance request in textual format to the connected ATC center.
  L2 The message is sent via CPDLC to the connected ATC center. This message should only be used in specific areas.

Ident.: DSC-46-ATC-20-30-30-10-00019599.0001001 / 23 APR 14

WHEN CAN WE EXPECT BUTTON

When the flight crew clicks the WHEN CAN WE EXPECT button, they have access to the following frames:

- HIGHER LEVEL
  The flight crew prepares a request message for a higher flight level.
  L2 HIGHER LEVEL cannot be selected at the same time as LOWER LEVEL.
  The selection of a HIGHER LEVEL after a LOWER LEVEL selection erases the previous selection.
- L1 LOWER LEVEL
  The flight crew prepares a request message for a lower flight level.
  L2 LOWER LEVEL cannot be selected at the same time as HIGHER LEVEL.
  The selection of a LOWER LEVEL after a HIGHER LEVEL selection erases the previous selection.
- L1 CLIMB TO
  The flight crew prepares a request message to climb to a specific flight level.
  L2 CLIMB TO cannot be selected at the same time as DESCEND TO.
  The selection of a CLIMB TO after a DESCEND TO selection erases the previous selection.
- L1 DESCEND TO
  The flight crew prepares a request message to descend to a specific flight level.
  L2 DESCEND TO cannot be selected at the same time as CLIMB TO.
  The selection of a DESCEND TO after a CLIMB TO selection erases the previous selection.
- L1 CRUISE CLIMB
  The flight crew prepares a request message to cruise climb to a specific flight level.
- SPEED
  The flight crew prepares a request message for a specific speed.
- SPEED RANGE
  The flight crew prepares a request message for a speed within a specific range.
- BACK ON ROUTE.
  The flight crew prepares a request message to go back to the initial route.

Ident.: DSC-46-ATC-20-30-30-10-00019600.0001001 / 23 APR 14

OTHER BUTTON

When the flight crew clicks the OTHER button, they have access to the following frames:

- FREETEXT
- VOICE CONTACT
- OWN SEPARATION & VMC
- VMC DES.

Ident.: DSC-46-ATC-20-30-30-10-00019601.0001001 / 23 APR 14

ADD TEXT BUTTON

The flight crew can add reasons to a request, with the use of short predefined messages or freetext messages:

- DUE TO WEATHER
- DUE TO A/C PERFORMANCE
- DUE TO TURBULENCE
- DUE TO TECHNICAL
- DUE TO MEDICAL
- AT PILOTS DISCRETION
- FREETEXT.

Note: *The flight crew can only insert an ADD TEXT frame when another frame is already included in the request. A message cannot contain an ADD TEXT frame on its own.*

Ident.: DSC-46-ATC-20-30-30-10-00000601.0001001 / 23 APR 14

CANCEL BUTTON

When clicked, clears the REQUEST page, and the default ATC COM page appears.

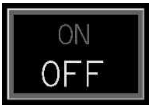
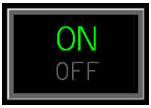
AUTO POSITION REPORT BUTTON



The AUTO POSITION REPORT is OFF.



The AUTO POSITION REPORT is ON.

Ident.: DSC-46-ATC-20-30-40-10-00000604.0001001 / 04 DEC 14

POSITION

- OVHD (Overhead)
  Indicates the last FMS-sequenced waypoint. The time and altitude overhead this waypoint are also provided.
  L2 A report can still be sent if these fields remain empty (if no data from the FMS or the flight crew).
- L1 PPOS (Present position)
  Indicates the current aircraft position. The time and altitude at this position are also provided.
  L2 When empty, these fields are replaced by amber boxes. If no data from the FMS is available, the flight crew must manually fill in the PPOS fields, in order to send a report.
- L1 TO (To waypoint)
  Indicates the waypoint to be sequenced in the FMS. The expected time overhead this waypoint is also provided.
  L2 A report can still be sent if these fields remain empty (if no data from the FMS or the flight crew).
- L1 NEXT.
  Indicates the waypoint to be sequenced in the FMS after the TO waypoint.
  L2 A report can still be sent if these fields remain empty (if no data from the FMS or the flight crew).

Ident.: DSC-46-ATC-20-30-40-10-00000605.0001001 / 04 DEC 14

SPEED AND HEADING

- SPD
  Indicates the airspeed of the aircraft.
  L2 A report can still be sent if this field remains empty (if no data from the FMS or the flight crew).
- L1 GND SPD
  Indicates the aircraft ground speed.
  L2 A report can still be sent if this field remains empty (if no data from the FMS or the flight crew).

L1 - V/S
Indicates the vertical speed of the aircraft.
L2 A report can still be sent if this field remains empty (if no data from the FMS or the flight crew).

L1 - HDG
Indicates the aircraft heading.
L2 A report can still be sent if this field remains empty (if no data from the FMS or the flight crew).

L1 - TRK
Indicates the aircraft track.
L2 A report can still be sent if this field remains empty (if no data from the FMS or the flight crew).

Ident.: DSC-46-ATC-20-30-40-10-00000606.0001001 / 04 DEC 14

WEATHER CONDITIONS

- WIND
Indicates the wind direction and speed.
L2 A report can still be sent if both fields remain empty (if no data from the FMS or the flight crew). One field cannot remain empty if the other one is filled in.

L1 - SAT
Indicates the Static Air Temperature (SAT).
L2 A report can still be sent if this field remains empty (if no data from the FMS or the flight crew).

L1 - ICING
This is a flight crew entry.

The flight crew selects an icing condition from the following list:
- " ": empty, no information available
- Trace
- Light
- Moderate
- Severe.

- TURB.
This is a flight crew entry.

The flight crew selects a turbulence condition from the following list:
- " ": empty, no information available
- Light
- Moderate
- Severe.

Ident.: DSC-46-ATC-20-30-40-10-00000607.0001001 / 04 DEC 14

INFORMATION

- ETA DEST
  Indicates the Estimated Time of Arrival.
  L2 A report can still be sent if this field remains empty (if no data from the FMS or the flight crew).
- L1 ENDURANCE
  Indicates the remaining flight time taking into account the long range cruise speed, and the remaining Fuel On Board (FOB). The endurance is indicated in hours and minutes.
  This is a flight crew entry.
- DEVIATING
  Indicates the aircraft offset with respect to the flight plan. In order to use the DEVIATING field, the flight crew must tick the associated box.
  L2 When the box is ticked, the associated DEVIATING field must be filled in.
- L1 CLIMBING TO/DESCENDING TO
  These two selections are exclusive. In order to use the CLIMBING TO or the DESCENDING TO field, the flight crew must tick the associated box.
  L2 When a box is ticked, the associated altitude or flight level field must be filled in.
  L1 The target altitude or flight level is entered on the FCU, and sent via the FMS.

REFRESH DATA BUTTON

REFRESH
DATA

When clicked, updates the data displayed on the REPORT/AUTO & MANUAL POSITION page.
All fields are completed with data from the FMS except the ICING, TURB, and ENDURANCE fields that are cleared. The freetext messages do not change.

Ident.: DSC-46-ATC-20-30-40-10-00000610.0001001 / 23 APR 14

ADD FREETEXT BUTTON / MODIFY FREETEXT BUTTON

ADD
FREETEXT

When clicked, the MFD page changes to FREETEXT.

On this page:
- The AUTO POSITION REPORT indication is not displayed
- The position report data appears in non-modifiable format
- Only the freetext frame can be modified
- There is a RETURN TO REPORT button that enables to go back to the basic page.

MODIFY
FREETEXT

Displayed instead of the ADD FREETEXT button, when the flight crew already edited the freetext frame.

Ident.: DSC-46-ATC-20-30-40-10-00000611.0001001 / 23 APR 14

XFR TO MAILBOX BUTTON

L12

XFR
TO MAILBOX

When clicked, transfers any valid report to the mailbox.
This is only possible when all the fields with amber boxes are correctly completed.
In order to send the message, the flight crew must click on the SEND button of the mailbox.

Ident.: DSC-46-ATC-20-30-40-10-00000657.0001001 / 04 DEC 14

STATUS MESSAGES

The following messages appear in the middle of the page.

POS REPORT NOT AVAIL - NO ACTIVE ATC - CHECK NOTIFICATION	There is no active ATC center.
POS REPORT NOT AVAIL - WITH CURRENT ATC	No position report message can be sent to the active ATC center. Appears when a FANS B connection is active.

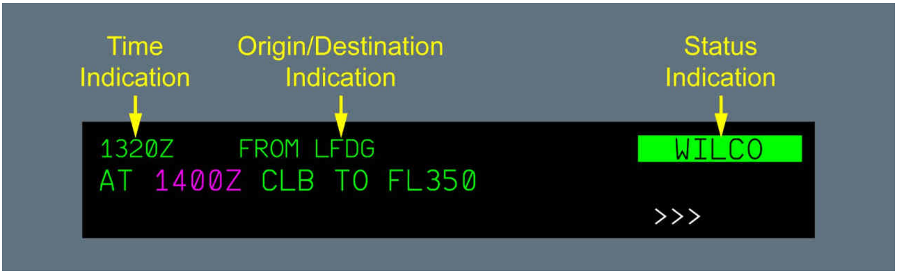
The MSG RECORD/ALL MSG page enables the flight crew to:
- Access all the messages previously exchanged with the ATC and the associated responses
- Print one or several recorded messages
- Erase all recorded messages.

Ident.: DSC-46-ATC-20-30-50-10-00018471.0001001 / 23 APR 14

MESSAGE AREA

Closed messages that ATC centers and the aircraft exchanged, are stored in this area. The most recent message is displayed at the top.
When no message is stored, NO STORED MSG appears in the middle of the page.

Message area



TIME INDICATION

Indicates the UTC time at which:
- The ATC center sent the uplink message
- The flight crew sent the downlink message to the ATC center.

ORIGIN/DESTINATION INDICATION

Indicates the active ATC center that sent/received the message.

STATUS INDICATION

The status of a stored message is the status that this message had, at the moment it was closed from the mailbox. In the MSG RECORD page, the status of a message appears in black on a green background (except for OPEN and ABORT).

L2 For more information about the different message status, *Refer to DSC-46-ATC-20-60 Message Status*.

Ident.: DSC-46-ATC-20-30-50-10-00018472.0001001 / 23 APR 14

ERASE ALL BUTTON

When clicked, and after confirmation, erases all recorded messages from the list.

Note: *If the flight crew clicks on this button while one of the recorded messages appears on the other MFD, no message is erased, and the MSG RECORD USED OFFSIDE message appears in the ATC COM message area.*

Ident.: DSC-46-ATC-20-30-50-10-00018473.0001001 / 04 DEC 14

PRINT BUTTON

When clicked, proposes three entries that enable the flight crew to print:
- The recorded messages of the current flight, or
- The recorded messages of the previous flight (if any), or
- One or all the recorded messages.

Ident.: DSC-46-ATC-20-30-50-10-00018474.0001001 / 23 APR 14

EXPAND BUTTON

When the flight crew clicks on any message, the MSG RECORD/ALL MSG/EXPAND page appears and the entire message is displayed. The PRINT button allows the flight crew to print the message.
To display the list again, the flight crew must click on the RETURN TO LIST button.

Ident.: DSC-46-ATC-20-30-50-10-00019617.0001001 / 23 APR 14

FLIGHT NUMBER INDICATION

The flight number indication allows the flight crew to identify the messages from a previous flight.

AAA/180°/512KILOMETER 0 ...... >>>

The MSG RECORD/MONITORED MSG page enables the flight crew to:
- Access the messages that the FMS monitors
- Cancel the monitoring (and its associated reminder) related to a message.

A message is stored in the MSG RECORD/MONITORED MSG page when:
- The flight crew selects the ROGER button (in the case of a report request) or the WILCO button (in the case of a deferred clearance) of the mailbox
- The FMS can monitor the parameters.

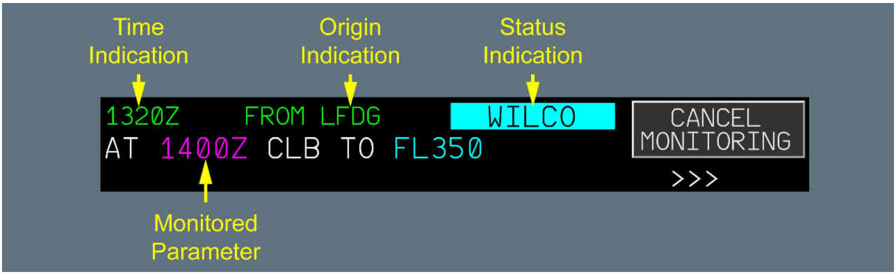
A monitored message is automatically removed from the MSG RECORD/MONITORED MSG page when:
- The associated reminder is displayed on the mailbox, or
- The monitoring is canceled, or
- The monitoring function is lost, not available, or failed.

Ident.: DSC-46-ATC-20-30-50-20-00018476.0001001 / 23 APR 14

MESSAGE AREA

The messages that the FMS monitors are stored in this area. The most recent message is displayed at the top. When no monitored message is stored, NO MONITORING IN PROGRESS appears in the middle of the page.

Message area



1320Z FROM LFDG
AT 1400Z CLB TO FL350

TIME INDICATION

Indicates the UTC time at which the ATC center sent the message.

ORIGIN INDICATION

Indicates the active ATC center that sent the message.

MONITORED PARAMETER

Monitored parameters are displayed in magenta.

STATUS INDICATION

The status of a monitored message is either ROGER or WILCO depending on the type of uplink message received.

ROGER

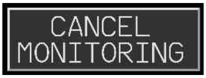
Appears when the flight crew clicked on the ROGER button of the mailbox, following the receipt of a report request from the ATC center.

WILCO

Appears when the flight crew clicked on the WILCO button of the mailbox, following the receipt of a deferred clearance from the ATC center.

Ident.: DSC-46-ATC-20-30-50-20-00018477.0001001 / 23 APR 14

CANCEL MONITORING BUTTON



CANCEL MONITORING

When clicked, and after confirmation, cancels the monitoring of the message.

Ident.: DSC-46-ATC-20-30-50-20-00018478.0001001 / 23 APR 14

EXPAND BUTTON

Some messages displayed on the MSG RECORD/MONITORED MSG page may not be complete. When the flight crew clicks on any message, the MSG RECORD/MONITORED MSG/EXPAND page appears and the entire message is displayed.
To display the list again, the flight crew must click on the RETURN TO LIST button.

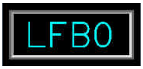
AIRPORT ENTRY FIELD

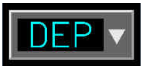


LFBO

Enables the flight crew to enter the ICAO code of the airport to which the request is sent.

Ident.: DSC-46-ATC-20-30-60-10-00000624.0001001 / 23 APR 14

ATIS TYPE LIST



DEP

For a given airport, enables the flight crew to select a departure ATIS (DEP) or an arrival ATIS (ARR).

Ident.: DSC-46-ATC-20-30-60-10-00000625.0001001 / 23 APR 14

ATIS VERSION INDICATION

Z	Indicates the ATIS version.
-	The ATIS version is not available.

Ident.: DSC-46-ATC-20-30-60-10-00000626.0001001 / 23 APR 14

ATIS TIME INDICATION

1245Z	Indicates the time of the weather sequence of the ATIS message.
- - - -	The time of the weather sequence of the ATIS message is not available.

Ident.: DSC-46-ATC-20-30-60-10-00000627.0001001 / 04 DEC 14

NEW ATIS SYMBOL

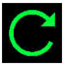
Indicates the reception of a new ATIS message.

The symbol disappears when:

- The flight crew selects the D-ATIS/LIST page of the MFD and the entire ATIS message fits on this page, or
- The flight crew selects the D-ATIS/RECEIVED page of the MFD, because the entire ATIS message does not fit on the D-ATIS/LIST page.

Ident.: DSC-46-ATC-20-30-60-10-00000628.0001001 / 23 APR 14

AUTO UPDATE SYMBOL



Indicates that the flight crew selected the auto update function from the UPDATE OR PRINT pop-up menu.
The ATIS message is automatically updated when a new ATIS version is available.

Note: *This function is not available for a departure ATIS.*

Ident.: DSC-46-ATC-20-30-60-10-00000629.0001001 / 23 APR 14

AUTO PRINT SYMBOL

Indicates that the flight crew selected the auto print function from the UPDATE OR PRINT pop-up menu.
The ATIS message is automatically printed when a new ATIS version is available.

Ident.: DSC-46-ATC-20-30-60-10-00000630.0001001 / 23 APR 14

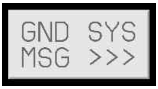
MESSAGE STATUS/FSM BUTTON

PREDEFINED MESSAGES

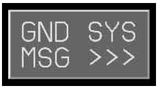
As soon as a predefined message is received, the associated indication appears on the Message Status/FSM (Flight System Message) button.

Indication Displayed	Meaning
SENDING	Appears when the flight crew clicks on: - The SEND REQUEST button, or - The AUTO UPDATE button, or - The UPDATE item of the UPDATE OR PRINT pop-up menu, or - The AUTO UPDATE item of the UPDATE OR PRINT pop-up menu.
SENT	Appears when the message is received on ground.
USE VOICE	Appears when: - The ATC center detects a problem in the ATIS request, or - D-ATIS is not available with the selected ATC center.
SEND FAILED	Appears if: - A negative acknowledgment is received, or - No acknowledgement from the ground is received within 6 min.
NO REPLY	Appears if the D-ATIS report is not received within 7.5 min.
NO AUTO UPDATE	Appears when the ATC center does not support automatic update contract. However, the ATC center will send a single ATIS message.
END OF UPDATE	Appears when: - The ATC center received a message indicating the end of the automatic update contract, and closes the automatic update process, or - The ATC center deleted the aircraft from its list of “aircraft under ATIS automatic update contract”.
ATIS X REJECTED	Appears when an ATIS is rejected.

NON PREDEFINED MESSAGES



Appears on the Message Status/FSM button, when a message that is not predefined is received.
When the flight crew clicks on the button, the D-ATIS/GROUND SYS MSG page appears on the MFD.
The flight crew must click on the RETURN TO LIST button to display the D-ATIS/LIST page again.



Appears on the Message Status/FSM button, when the flight crew viewed the message.

Ident.: DSC-46-ATC-20-30-60-10-00000631.0001001 / 23 APR 14

REQUESTING AND PRINTING BUTTONS

When either the AIRPORT entry field, or the ATIS TYPE list are updated, the SEND REQUEST and AUTO UPDATE buttons appear.
The UPDATE OR PRINT pop-up menu appears when an ATIS report is received.

SEND REQUEST BUTTON

SEND
REQUEST

When clicked, sends the ATIS request.

AUTO UPDATE BUTTON

AUTO
UPDATE

When clicked, sends the ATIS auto update request.

UPDATE OR PRINT POP-UP MENU

UPDATE
OR PRINT ▼

When clicked, displays a list including the following options:

UPDATE

When clicked, sends an ATIS update request.

AUTO UPDATE/CANCEL AUTO UPDATE

When clicked, selects or deselects the auto update function.

PRINT

When clicked, prints the last received ATIS message.

AUTO PRINT/CANCEL AUTO PRINT

When clicked, selects or deselects the auto print function.

Ident.: DSC-46-ATC-20-30-60-10-00000633.0001001 / 23 APR 14

MESSAGE AREA

The ATIS messages appear in this area.
When an ATIS message cannot be entirely displayed in the message area, white dots appear instead of the last 9 characters.

The >>> button enables the flight crew to display the entire ATIS message on the D-ATIS/RECEIVED page. When the flight crew clicks on the PREVIOUS tab of the D-ATIS/RECEIVED page, the previous ATIS is displayed.
In order to return to the D-ATIS/LIST page, the flight crew must click on the RETURN TO LIST button.

Ident.: DSC-46-ATC-20-30-60-10-00000634.0001001 / 23 APR 14

PRINT ALL BUTTON

When clicked, prints all the ATIS messages currently displayed.

Ident.: DSC-46-ATC-20-30-60-10-00000636.0001001 / 23 APR 14

UPDATE ALL BUTTON

When clicked, initiates an update request for all the ATIS messages, except those for which:
- An auto update contract is already active, or
- An update request is in 'waiting' state.

Note: *If communication is not available when the flight crew clicks on the UPDATE ALL button, nothing changes on the D-ATIS/LIST page and the COM DATALINK NOT AVAIL message appears in the ATC COM message area.*

In order to build an emergency message, the flight crew can use the predefined frames accessible via the EMERGENCY page. The empty fields contained in the frames indicate where the flight crew can enter complementary information. These fields must be filled in when they contain amber boxes. The flight crew can use up to 5 frames in an emergency message.

Some frames combinations are not permitted.

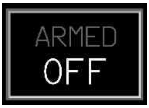
Note: *1. CPDLC emergency messages are only available with FANS A.*
2. The ADS-C Emergency is available with FANS A or B.

Ident.: DSC-46-ATC-20-30-70-10-00000637.0001001 / 23 APR 14

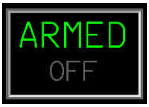
ADS-C EMERGENCY BUTTON

When no ATC center is connected, the ADS-C EMERGENCY button is OFF or ARMED.
When at least one ATC center is connected, the ADS-C EMERGENCY button is OFF or ON.

WHEN NO ATC CENTER IS CONNECTED

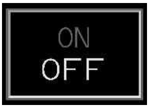


Indicates that the ADS-C Emergency is OFF.
This is the default state.
When clicked, the ADS-C Emergency status changes to ARMED. If the ADS-C was OFF, it automatically changes to ARMED.

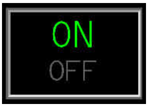


Indicates that the ADS-C Emergency is ARMED.
The status of the ADS-C Emergency automatically changes to ON as soon as there is an ADS-C connection to an ATC center.
When clicked, the ADS-C Emergency status changes to OFF.

WHEN AT LEAST ONE ATC CENTER IS CONNECTED



Indicates that the ADS-C Emergency is OFF.
This is the default state.
When clicked, the ADS-C Emergency status changes to ON.



Indicates that the ADS-C Emergency is ON.
When clicked, the ADS-C Emergency status changes to OFF.

Ident.: DSC-46-ATC-20-30-70-10-00019636.0001001 / 23 APR 14

MAYDAY BUTTON

When clicked, a downlink message is created on the EMERGENCY page of the MFD in order to indicate a critical failure on board.
The ADS-C Emergency automatically activates when the MAYDAY message is sent from the mailbox. The message SENDING MAYDAY WILL SWITCH - ADS-C TO EMERGENCY appears in the ATC COM message area.

Ident.: DSC-46-ATC-20-30-70-10-00019637.0001001 / 23 APR 14

PANPAN BUTTON

When clicked, a downlink message is created on the EMERGENCY page of the MFD in order to indicate a major failure on board.

Ident.: DSC-46-ATC-20-30-70-10-00019638.0001001 / 04 DEC 14

CANCEL EMER BUTTON

When clicked, a downlink message is created on the EMERGENCY page of the MFD. When sent from the mailbox, this message cancels the previous emergency message that the flight crew sent. At the same time, the ADS-C Emergency is deactivated.

Ident.: DSC-46-ATC-20-30-70-10-00019639.0001001 / 23 APR 14

CLIMBING TO BUTTON

When clicked, adds to the message the FCU-selected altitude or flight level for the climb.
The CLIMBING TO frame and the DESCENDING TO frame cannot be used in the same message.

Ident.: DSC-46-ATC-20-30-70-10-00019640.0001001 / 23 APR 14

DESCENDING TO BUTTON

When clicked, adds to the message the FCU-selected altitude or flight level for the descent.
The CLIMBING TO frame and the DESCENDING TO frame cannot be used in the same message.

Ident.: DSC-46-ATC-20-30-70-10-00019641.0001001 / 23 APR 14

DIVERTING/VIA BUTTON

When clicked, enables the flight crew to specify the route or the airport to which the aircraft diverts.

Ident.: DSC-46-ATC-20-30-70-10-00019642.0001001 / 23 APR 14

OFFSETTING BUTTON

When clicked, adds to the message the offset value from the flight plan.

Ident.: DSC-46-ATC-20-30-70-10-00019643.0001001 / 23 APR 14

REQUEST VOICE CONTACT BUTTON

When clicked, enables the flight crew to request a voice communication with the ATC center.
The entry field enables the flight crew to indicate the frequency they wish to use in order to contact the ATC center.
The default frequency is 121.5 MHz.

Ident.: DSC-46-ATC-20-30-70-10-00019644.0001001 / 23 APR 14

ENDURANCE & PERSONS BUTTON

When clicked, adds to the message the ENDURANCE and PERSONS ON BOARD entry fields.

The ENDURANCE entry field enables the flight crew to enter the maximum remaining flight time limited by the fuel autonomy.
The PERSONS ON BOARD entry field enables the flight crew to enter the number of people on board.

Ident.: DSC-46-ATC-20-30-70-10-00019645.0001001 / 23 APR 14

ADD FREETEXT BUTTON

When clicked, adds to the message a free text area.

Ident.: DSC-46-ATC-20-30-70-10-00000640.0001001 / 23 APR 14

CANCEL BUTTON

When clicked, clears the EMERGENCY page, and the default ATC COM page appears.

Ident.: DSC-46-ATC-20-30-70-10-00000639.0001001 / 23 APR 14

XFR TO MAILBOX BUTTON

L12

XFR
TO MAILBOX

When clicked, transfers any valid emergency message to the mailbox.
The transfer or a message is only possible when all the fields indicated by amber boxes are correctly completed.
In order to send the message, the flight crew must click the SEND button of the mailbox.

Ident.: DSC-46-ATC-20-30-70-10-00000622.0001001 / 15 JUL 14

STATUS MESSAGES

The following messages appear in the middle of the page.

EMER MSG NOT AVAIL - NO ACTIVE ATC - CHECK NOTIFICATION	There is no active ATC center.
EMER MSG NOT AVAIL - WITH CURRENT ATC - USE VOICE	No emergency message can be sent to the active ATC center. Appears when a FANS B connection is active.

DATA ENTRY FORMAT

Applicable to: ALL

Ident.: DSC-46-ATC-20-50-10-00000663.0001001 / 23 APR 14

This chapter lists the data that the flight crew can enter in the ATC COM pages of the MFD.

For each type of data, the table displays:
- The accepted format
- The accepted units
- The accepted range
- The page(s) where the flight crew enters the data.

The following characters are used to indicate the format:
- A: Letters
- B: Magnetic
- T: True reference
- N: Numeric (numbers)
- X: Alphanumeric (letters and numbers).

Note: *1. The units that the flight crew can enter are indicated in blue.*
2. Leading zeros can be omitted in fields that contain numerical data.

If the format entered is not valid, the FORMAT ERROR message appears in the ATC COM message area, followed by the associated correct format (*Refer to DSC-46-ATC-20-40 FORMAT ERROR*).
If the value entered is not valid, the ENTRY OUT OF RANGE message appears in the ATC COM message area, followed by the associated correct range (*Refer to DSC-46-ATC-20-40 ENTRY OUT OF RANGE*).

MFD OVERVIEW

Applicable to: ALL

Ident.: DSC-46-ATC-20-20-10-00000573.0001001 / 23 APR 14

The flight crew can access the default ATC COM page via:
- The ATC COM key on the KCCU, or
- The MFD system menu.

L2 For more information, *Refer to DSC-31-CDS-70-10 MFD*.

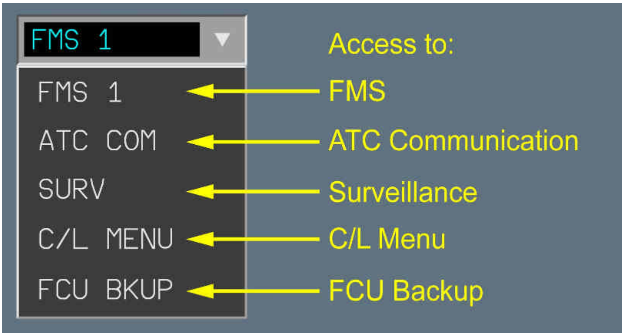
MFD SYSTEM MENU

MFD System Menu



In order to access the ATC COM pages, the flight crew selects the ATC COM identifier in the MFD system menu.

Ident.: DSC-46-ATC-20-20-10-00000575.0001001 / 23 APR 14

SHARED MESSAGE AREA

The shared message area displays messages in order to inform the flight crew about an event that is related to the FMS or ATC communication.
The shared message area displays the following messages:

D-ATIS RECEIVED	Indicates that a new ATIS report is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS GROUND MSG	Indicates that an ATIS FSM message is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
D-ATIS NO REPLY	Appears when the time-out (7.5 min) is reached and that no ATIS was received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.

D-ATIS SEND FAIL	Appears when an ATIS request failed for one of the following reasons: - The sending of the ATIS request failed, or - The time-out (6 min) for acknowledgement is reached, or - A negative answer for the ATIS request is received. Only appears if the MFD displays a page that is not an ATC COM page. Disappears when the flight crew accesses an ATC COM page.
CHECK FMS MESSAGE	Indicates that the FMS triggered an amber FMS message. Only appears if the MFD displays a page that is not an FMS page. Disappears when the flight crew accesses an FMS page.
L12 IND	Indicates that both FMS operate in INDEPENDENT mode. For information about the INDEPENDENT mode, *Refer to DSC-22-FMS-40 INDEPENDENT Mode*.

L2 *Note: The shared message area displays only one message at a time. However, the IND message can appear in addition to another message.*

Ident.: DSC-46-ATC-20-20-10-00000577.0001001 / 04 DEC 14

GENERAL MENU BAR

The general menu bar provides the flight crew with access to the main ATC COM pages.
The main ATC COM pages are divided into 6 groups, that correspond to the 6 menus of the general menu bar: CONNECT, REQUEST, REPORT & MODIFY, MSG RECORD, D-ATIS and EMER.

Note: A box around the menu name indicates that the displayed page belongs to this menu.

Ident.: DSC-46-ATC-20-20-10-00000578.0001001 / 04 DEC 14

ATC COM PAGE HEADER

The ATC COM page header indicates the title of the ATC COM page currently displayed.
A slash in the page title indicates the level of the page hierarchy, for example: REPORT/AUTO & MANUAL POSITION.

Ident.: DSC-46-ATC-20-20-10-00018576.0001001 / 23 APR 14

FLIGHT NUMBER

Refer to DSC-22-FMS-20-20-20 INIT Page.

Intentionally left blank

MANUAL TIME SETTING

Ident.: DSC-46-ATC-30-00000965.0001001 / 07 NOV 16
Applicable to: ALL

The ADIRS normally provides the time information for all aircraft systems, based on GPS data. In the case of a loss of GPS , the ADIRS will keep the last GPS time data and compute an internal time.

● **If the flight crew sets the ACFT TIME REF option on the POSITION/TIME FMS page to MANUAL:**

- The ATC Datalink system will inhibit the use of the CPDLC, including departure and oceanic clearance applications
- The ADS-C application will continue to operate but in degraded mode

L2 The ADS-C application is degraded due to the downgraded accuracy of the position data.

L1
- The D-ATIS application will continue to operate.

OVERVIEW

Ident.: DSC-46-OIS-10-10-00013369.0001001 / 02 MAY 14
Applicable to: ALL

The Onboard Information System (OIS) provides software applications for flight operations, maintenance, and cabin activities.

The flight crew uses the OIS to access the following tools and information:
- The aircraft performance applications
- The navigation charts
- The mission management information
- The aircraft operating manuals
- The Operator's documentation
- The company communication application

The OIS has two sides:
- The Avionics (AVNCS) side, that contains the avionics and maintenance applications
- The Electronic Flight Bag (EFB) side, that contains the flight operations applications.

The Control and Display System (CDS) displays the OIS information.

AVNCS SIDE

Each flight crewmember can use the OIS sw or the OIS keyboard to display the AVNCS side.

COMPANY COM

The AVNCS side hosts the airline operational communication (COMPANY COM).

L2

OIS AVNCS SERVER

The OIS AVNCS server hosts the flight and maintenance applications that are connected to the aircraft avionics systems (e.g the COMPANY COM application)

OIS CAB & MAINT SERVER

The OIS CAB & MAINT server:
- Hosts the flight, maintenance and cabin applications
- Ensures the connections with the EFBs

- Ensures the connection with the printer
- Is connected to the external communication means (gatelink, SATCOM, GSM, GPRS)
- Provides the CDS with video signal.

The OIS CAB & MAINT server receives avionics data via the OIS AVNCS server.
For data security reasons, the OIS CAB & MAINT server cannot send data to the OIS AVNCS server, except for notifications and display.

Ident.: DSC-46-OIS-10-20-01-00001031.0001001 / 02 MAY 14

EFB SIDE

Each flight crewmember can use the OIS sw or the OIS keyboard to display the EFB side.
The EFB side is the content of the laptop that is plugged on the onside docking station.

LAPTOP DOCKING STATION

There are two laptop docking stations:
- One laptop docking station for the Captain (CAPT)
- One laptop docking station for the First Officer (F/O).

Each laptop docking station hosts one laptop and performs the interface between the laptop and the aircraft.

The main functions of the laptop docking station are:
- To dock and stow the laptop
- To power the laptop
- To interface the laptop with the OIS.

L2 For more information about the laptop docking station, *Refer to DSC-46-OIS-20-60 Overview*.

Ident.: DSC-46-OIS-10-20-01-00020538.0001001 / 09 MAR 16

EFB

Each EFB hosts the following flight crew applications:
- Documentation : OPS LIBRARY
  L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 OPS LIBRARY*)
- L1 Performance :
  - T.O PERF
    L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 T.O PERF*)
  - L1 LDG PERF
    L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 LDG PERF*)
  - L1 IN-FLT PERF
    L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 IN-FLT PERF*)
  - L1 LOADSHEET
    L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 LOADSHEET*)

L1
- Mission :
  - The FLT FOLDER

    L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 FLT FOLDER*)
  - L1 Navigation charts
- Utilities :
  - FLT OPS STS

    L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 FLT OPS STS*)
  - L1 LOAD BOX

    L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 LOAD BOX / EXPORT BOX*)
  - L1 EXPORT BOX

    L2 (For more information about the application, *Refer to DSC-46-OIS-10-30 LOAD BOX / EXPORT BOX*)

L1 *Note:* *Operators can install other applications.*

L2 CAPT, F/O and spare EFB (EFB3) ◁ are synchronised.
Each EFB exchanges aircraft avionics data with the OIS CAB & MAINT server.
For data security reasons, the EFBs cannot send data to the OIS AVNCS server.

Ident.: DSC-46-OIS-10-20-01-00019859.0001001 / 02 MAY 14

SPARE EFB (EFB3) ◁

The spare EFB is an optional laptop that is automatically updated, and that can be used as a backup.

L2 The spare EFB, is synchronized for data installation via the LOADBOX only. The spare EFB is not synchronized for FLT FOLDER, FLT OPS STS and Charts.

L1 For more information about the spare EFB, *Refer to DSC-46-OIS-20-60 Overview*.

Ident.: DSC-46-OIS-10-20-01-00019861.0001001 / 02 MAY 14

COMMUNICATION

The OIS can exchange data with the ground. These data can be messages, mission data (loadsheet, EFF), database update, operational manuals update, or software updates.

L2 The following communication means can be used:
- SATCOM, for wireless exchanges in flight or on ground, via satellite
- Gatelink, for wireless exchanges on ground, via WIFI network, if the airport is equipped
- Wired gatelink, for wired exchanges on ground, in an hangar for example
- GSM, GPRS, for exchanges on ground, via mobile phones network.
- ACARS, for wireless exchanges, in flight or on ground. ACARS is used by the COMPANY COM application
- USB ports can also be used to exchange data.

Ident.: DSC-46-OIS-10-20-01-00019862.0001001 / 02 MAY 14

PRINTER

The flight crew can use the printer to print ATC or company messages, flight plan data, flight plan reports etc.

L2 The OIS manages the print function, and the print requests from FMS and ATC.

Ident.: DSC-46-OIS-10-20-01-00019863.0001001 / 02 MAY 14

L2 SECURED COMMUNICATION INTERFACE (SCI)

There are two SCIs (one is active, the other one works as a back-up).
The active SCI enables the communication between the OIS and the aircraft avionics systems.
The loss of both SCIs is one of the triggering conditions of the ECAM alert : COM OIS/AVNCS DATA XFR FAULT (*Refer to procedure*).

MISSION

Applicable to: ALL

Ident.: DSC-46-OIS-10-30-10-00001047.0001001 / 02 MAY 14

FLT FOLDER

ELECTRONIC FLIGHT FOLDER

An Electronic Flight Folder (EFF) is organized via a tree structure of folders and documents.
Operators can customize the structure and the content.
The airline operations center prepares an EFF on ground.

The flight crew can load an EFF on the aircraft via:
- The USB ports
- The air-ground communication tools.

After the flight, the flight crew can send EFF's back to the airline operations center.

FLT FOLDER APPLICATION

The FLT FOLDER application enables the flight crew to perform the following actions:
- Display the EFFs
- Store information from other EFB applications
- Centralize all the mission-related information
- Monitor and log the progress of the flight
- Send the documents to a ground archiving system.

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-80 FLT FOLDER*.

Ident.: DSC-46-OIS-10-30-10-00001045.0001001 / 02 MAY 14

NAVIGATION CHARTS

The navigation charts application enable the flight crew to display en route and terminal charts.

EN ROUTE

The en route charts can be either:
- A digital copy of the paper chart, or
- An interactive chart, that offers a customizable level of detail. The interactive chart provides more information about the objects in the chart and displays the aircraft position.

TERML CHART

The TERML CHART application provides the flight crew with airport charts, and contains:
- General airport information
- Maps of the taxiway, and parking facilities
- Departure, arrival, and approach procedures.

The flight crew can make a selection of airports from the application database, to enable quick access to the preselected airports.
The departure and destination airports appear in the selection if they are entered in the FLT OPS STS page.

DOCUMENTATION

Applicable to: ALL

Ident.: DSC-46-OIS-10-30-20-00001041.0001001 / 03 SEP 14

The flight crew can use the OPS LIBRARY application to display:
- The Flight Crew Operating Manual (FCOM)
- The Flight Crew Techniques Manual (FCTM)
- The Cabin Crew Operating Manual (CCOM)
- The Minimum Equipment List (MEL)
- The Configuration Deviation List (CDL)
- The Weight and Balance Manual (WBM)
- The Airplane Flight Manual (AFM).

In accordance with the airline needs, the Operator can remove, add or modify the manuals.
The OPS LIBRARY application includes a Quick Access tab that enables the flight crew to easily access some procedures or documentation. The Operator can customize the links that are available in the Quick Access tab.

Note: *The OPS LIBRARY can display PDF files. The flight crew must not attempt to print individual pages of the PDF file onboard the aircraft, in order to avoid printing the entire file.*

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-70 OPS LIBRARY*.

PERFORMANCE

Applicable to: ALL

Ident.: DSC-46-OIS-10-30-30-00001043.0001001 / 02 MAY 14

T.O PERF

The flight crew enters airfield, aircraft and environmental data to enable the application to compute takeoff performance data.

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-90 T.O PERF*.

Ident.: DSC-46-OIS-10-30-30-00016284.0001001 / 02 MAY 14

LOADSHEET

The LOADSHEET application computes aircraft weight and balance data.

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-120 LOADSHEET*.

Ident.: DSC-46-OIS-10-30-30-00016285.0001001 / 02 MAY 14

LDG PERF

The flight crew enters airfield, aircraft and environmental data to enable the application to compute landing performance data.

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-110 LDG PERF*.

Ident.: DSC-46-OIS-10-30-30-00016286.0001001 / 02 MAY 14

IN-FLT PERF

The flight crew enters airfield, aircraft and environmental data to enable the application to compute in-flight performance data.

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-100 IN-FLT PERF*.

UTILITIES

Applicable to: ALL

Ident.: DSC-46-OIS-10-30-40-00016094.0001001 / 02 MAY 14

FLT OPS STS

The flight crew must insert aircraft and flight information in order to initialize the FLT OPS STS page.

The flight crew can enter the following parameters:
- The aircraft type
- The aircraft registration number
- The flight number
- The departure airport
- The destination airport
- The weight variant.

The other applications initialize in accordance with the parameters from the FLT OPS STS page. If the flight number, the departure airport and the destination airport are entered in the FMS, the flight crew can use the SYNCHRO AVIONICS button to reuse them in the FLT OPS STS page.

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-60 FLT OPS STS*.

Ident.: DSC-46-OIS-10-30-40-00001039.0001001 / 02 MAY 14

LOAD BOX / EXPORT BOX

The flight crew uses the LOAD BOX and the EXPORT BOX to transfer data to and from the EFBs.
The LOAD BOX transfers data into the EFB.
The EXPORT BOX transfers data out of the EFB.
The data can be EFFs, performance data, updates of manuals, etc.
The data transfer between the aircraft and the ground can be achieved either via a physical device, such as a USB key, or via a wireless connection, such as GATELINK or SATCOM.

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-140 EXPORT BOX*.

L1 LOAD BOX

When a data loading is started, it applies on all the connected laptops.
When a data is available on a USB key, the associated line appears only in the LOAD BOX of the laptop that is connected to the USB key.
When a data is available on GATELINK, the associated line appears in the LOAD BOX of all the laptops in the cockpit.

L2 For more information about the application, *Refer to DSC-46-OIS-20-80-130 LOAD BOX*.

COMPANY COM

Ident.: DSC-46-OIS-10-40-00001055.0001001 / 02 MAY 14

Applicable to: ALL

The flight crew and the airline ground stations use the COMPANY COM application to exchange information.
The COMPANY COM application transmits messages via the ACARS.

Operators can use the COMPANY COM application to manage flight operations such as:
- Schedule
- Route
- Diversion
- Ramp service requests
- Weather report
- Delays report
- Flight parameters report.

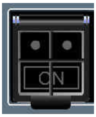
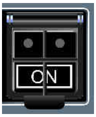
COM GND CONNECTION PB-SW

Ident.: DSC-46-OIS-20-30-00018286.0001001 / 02 MAY 14
Applicable to: ALL

The COM GND CONNECTION pb-sw is a guarded pushbutton switch that is used for maintenance purpose only.



The maintenance personnel cannot connect a portable maintenance access terminal to the OIS.



The maintenance personnel pressed the COM GND CONNECTION pb-sw. For maintenance purpose on ground, the maintenance personnel can connect a portable maintenance access terminal to the OIS.

Note: *For maintenance and security purpose only. the flight crew should comply with the associated company instructions.*

Intentionally left blank

KCCU CONTROLS FOR THE OIS

Applicable to: ALL

Ident.: DSC-46-OIS-20-50-10-00015902.0001001 / 02 MAY 14

There are two Keyboard and Cursor Control Units (KCCUs) on the pedestal:
- One KCCU for the Captain (CAPT)
- One KCCU for the First Officer (F/O).

The flight crew can use the KCCU to enter and modify data on the OIS

DOCK STATION PB

The DOCK STATION pb is a guarded pushbutton.

 	The laptop docking station is OFF. When pressed, the laptop docking station turns on. *Note:* *However, the laptop will stay ON or OFF*
 	The laptop docking station is ON. When pressed, the laptop docking station turns off. *Note:* *However, the laptop will stay ON or OFF*

L2 *Note:* *At aircraft power-up, the DOCK STATION pb will be in the same state as before aircraft shut down.*
When the laptop docking station is OFF, the laptop is disconnected from electrical power, avionics, OIS keyboard and display units.

Ident.: DSC-46-OIS-20-60-10-00015897.0001001 / 02 MAY 14

PWR SPLY LIGHT

 	The laptop docking station supplies electrical power to the laptop.
 	The laptop docking station does not supply electrical power to the laptop.

Ident.: DSC-46-OIS-20-60-10-00015898.0001001 / 02 MAY 14

LAPTOP PB

 	The laptop is connected to the docking station, and is not running. When pressed, starts the laptop.
 	The laptop is running, or is not connected, or the docking station is off. When pressed, no effect.

L2 For more information, *Refer to DSC-46-OIS-30 How To Start the EFB Device*

L3 *Note: The LAPTOP START function is available if the laptop and the laptop docking station are paired. In order to pair one laptop with one laptop docking station, the flight crew must turn on the laptop, then plug it into the laptop docking station. This procedure is required only for the first connection between a laptop and a laptop docking station.*

Ident.: DSC-46-OIS-20-60-10-00015899.0001001 / 02 MAY 14

ON LIGHT

	The laptop is ON, and operational.
	The laptop is OFF, or not plugged.

Ident.: DSC-46-OIS-20-60-10-00018314.0001001 / 02 MAY 14

OUTPUT USB PORT

The flight crew can use the output USB port to load, or to export data to a USB key.

Ident.: DSC-46-OIS-20-60-10-00018315.0001001 / 02 MAY 14

VIDEO PORT

The flight crew can connect the laptop to one video port (DVI or VGA).
The system administrator defines the port to be used.

Ident.: DSC-46-OIS-20-60-10-00018316.0001001 / 02 MAY 14

INPUT USB PORT

The input USB port provides connection between the laptop and the OIS Keyboard and the KCCU. The input USB port can also provide video connection between the laptop and the CDS. If the video over USB function is not active, the flight crew can use one video port in order to connect the laptop and the CDS.

Ident.: DSC-46-OIS-20-60-10-00018317.0001001 / 02 MAY 14

ETHERNET PORT

The ethernet port provides a connection between the laptop and the aircraft avionics.

Ident.: DSC-46-OIS-20-60-10-00018318.0001001 / 02 MAY 14

POWER SUPPLY

The power supply provides electric power to the battery of the laptop.

Ident.: DSC-46-OIS-20-60-10-00015911.0001001 / 02 MAY 14

USB PORT

There is one USB port on each lateral console:
- One for the Captain (CAPT)
- One for the First Officer (F/O).

Each USB port is connected to the onside laptop docking station.
The flight crew can use the USB ports to load, or to export data.

Ident.: DSC-46-OIS-20-60-10-00022512.0001001 / 23 OCT 17

POWER OUTLET

The flight crew can use the power outlet (110 VAC / 60 Hz) to plug a Portable Electronic Device (PED).

Ident.: DSC-46-OIS-20-60-10-00015812.0001001 / 02 OCT 14

SPARE EFB (EFB3) ◁

The spare EFB is stowed above the coat stowage.
The flight crew can power-up, or shut down the spare EFB via a shortcut available in the FLT OPS MENU.

L2 For more information about the FLT OPS MENU,*Refer to DSC-46-OIS-20-80-50 FLT OPS MENU Overview*

L1 The flight crew cannot use the spare EFB as long as it is stowed.
In the case of CAPT and F/O laptop failure, the flight crew can strap the spare EFB on the lateral console, and use it as standalone until the maintenance has checked the docking station.

The spare EFB is connected to the power supply and aircraft network via:
- One electrical power plug that charges the battery of the laptop.
- One ethernet plug that enables to update the EFB, when the EFB is on.

NAVIGATION BAR

The flight crew can use the navigation bar to display an application.
Only the running applications from the EFB side appear in the navigation bar.
The size of the screen limits the number of buttons available. If some buttons cannot be displayed, the flight crew can press the navigation arrows in order to display additional buttons.
If an application is not running, there is no corresponding button in the navigation bar. The flight crew can use the MENU list or the FLT OPS MENU to start an application.

Ident.: DSC-46-OIS-20-80-10-10-00023740.0001001 / 24 MAY 17

AIRCRAFT REGISTRATION BUTTON

Displays the aircraft registration as defined on the FLT OPS STS page.
When pressed, displays the FLT OPS STS page.

Note: *If the aircraft registration is not provided on the FLT OPS STS page, the label of the aircraft registration button changes to FLT OPS STS.*

Ident.: DSC-46-OIS-20-80-10-10-00023741.0001001 / 24 MAY 17

SETTINGS MENU BUTTON

When pressed, displays the settings menu.
A typical layout is illustrated below.

OIS MENU & LOGBOOK NOT AVAIL

For EFB display: use OIS switching (or press EFB key on keyboard)

Ident.: DSC-46-OIS-20-80-30-10-00017643.0001001 / 02 MAY 14

PURPOSE

The OIS MENU BACKUP enables the flight crew to display the COMPANY COM application in the case of a failure of the OIS MENU.

Ident.: DSC-46-OIS-20-80-30-10-00017644.0001001 / 02 APR 15

ACCESS

The flight crew can access the OIS MENU BACKUP by pressing SHIFT + OIS MENU on the OIS keyboard.
The OIS MENU BACKUP can also be displayed automatically, if the OIS MENU is failed or is not started.

Ident.: DSC-46-OIS-20-80-30-10-00017645.0001001 / 02 MAY 14

DISPLAY BUTTON

When pressed, the corresponding application is displayed full screen.

Ident.: DSC-46-OIS-20-80-30-10-00017646.0001001 / 02 MAY 14

RESTART BUTTON

When pressed, the corresponding application restarts. The flight crew shall not use this function, as the entered data will be lost.

Ident.: DSC-46-OIS-20-80-30-10-00017647.0001001 / 02 MAY 14

RESET DEFAULT SETTINGS BUTTON

When pressed, reset the default settings of the corresponding application. The flight crew shall not use this function, as the inputs from the flight crew will be lost.

Ident.: DSC-46-OIS-20-80-30-10-00017648.0001001 / 02 MAY 14

APPLICATION STATUS

Indicates the status of the application.

The status can be one of the following :
- ACTIVATED
- DEACTIVATED
- NO STATUS
- FAILED
- NOT INSTALLED

Ident.: DSC-46-OIS-20-80-30-10-00017649.0001001 / 02 MAY 14

MAINTENANCE MENU BACKUP TAB

When pressed, opens the tab that contains the list of maintenance applications. The flight crew shall not use the maintenance applications.

COMPANY COM FUNCTIONS

The COMPANY COM application performs the following functions :
- The message management function
- The Out-Off-On-In (OOOI) function.

MESSAGE MANAGEMENT FUNCTION

The COMPANY COM application either warns or advises the flight crew that a company message is received, depending on the message priority.

L2 The Operator can customize ECAM MEMOs and aural alerts, that are associated with the company message.

L1 The COMPANY COM automatically:
- Print specific types of company messages
- Send specific types of company messages
- Delete all messages from the mailbox at the end of each flight
- Store all messages in the appropriate directory (sent, inbox, or outbox)
- Perform additional functions, as applicable, depending on customization.

The COMPANY COM enables the flight crew to manually:
- Print messages
- Edit messages
- Zoom in the messages
- Store messages, as applicable, depending on customization
- Send free-text messages to specific company ground stations.

Note: *In the case of loss of transmission via the ACARS, the status of downlink messages may be erroneous, and uplink messages may not appear in the mailbox.*

OUT-OFF-ON-IN (OOOI) FUNCTION

The COMPANY COM application computes and sends automatic reports (OOOI reports) to the airline ground station.

The OOOI provides the Operator with details about:
- The aircraft status
- The flight status

- The flight progress
- The flight delay.

The COMPANY COM automatically sends the report at a predefined time during the flight (e.g. when the doors are closed, when the parking brake is off, when the landing gear is up (down), etc.). The Operator can customize the triggering conditions of the reports.
The flight crew can display the messages via the COMPANY COM application.

INTERFACE WITH AVIONICS

In association with the avionics domain, the COMPANY COM application:
- Exchanges information with the FWS via the Secure Communication Interface (SCI), in order to trigger the ECAM MEMOs and aural alerts when a message is received.
- Can automatically insert data from the avionics parameters into the messages
- Receives defined parameters (i.e. company identifier, flight number, etc) from the avionics.

Ident.: DSC-46-OIS-20-80-40-10-00001302.0001001 / 24 MAY 17

COMPANY COM APPLICATION

The COMPANY COM application has:
- The associated software
- A database, that can be:
  - A basic database, with the basic Airline Operational Communication (AOC) functions, or
  - A customized database.

Due to the fact that the operator can customize the COMPANY COM application, this chapter only provides a general description of the application, without description of the interface.

CAPT AND F/O SYNCHRONIZATION NOT AVAIL

Ident.: DSC-46-OIS-20-80-60-10-00018295.0001001 / 02 MAY 14

PURPOSE

The FLT OPS STS initializes some inputs for the other EFB applications, and provides the flight crew with a status of the EFB currently in use (error messages and EFB version).
The flight crew can synchronize the inputs with the aircraft avionics (FMS) or manually enter the inputs.

Ident.: DSC-46-OIS-20-80-60-10-00018296.0001001 / 24 MAY 17

ACCESS

The flight crew can access the FLT OPS STS via:

- The aircraft registration button, or
- The OIS MENU.

Ident.: DSC-46-OIS-20-80-60-10-00015037.0001001 / 24 MAY 17

AIRCRAFT TYPE LIST

The flight crew selects the appropriate aircraft type within the list.

Note: *The system administrator defines the list.*

Ident.: DSC-46-OIS-20-80-60-10-00015038.0001001 / 24 MAY 17

AIRCRAFT REGISTRATION LIST

The flight crew selects the appropriate aircraft in the list.

Note: *The system administrator defines the list.*

Ident.: DSC-46-OIS-20-80-60-10-00023533.0001001 / 24 MAY 17

WEIGHT VARIANT LIST

The flight crew selects the applicable weight variant in the list.

Ident.: DSC-46-OIS-20-80-60-10-00018297.0001001 / 02 MAY 14

SYNCHRO AVIONICS BUTTON

The flight crew can use the SYNCHRO AVIONICS button in order to copy the inputs from the FMS to the FLT OPS STS.

Ident.: DSC-46-OIS-20-80-60-10-00015040.0001001 / 24 MAY 17

FLIGHT NUMBER ENTRY FIELD

The flight crew can enter the flight number. If the flight number is available in the database, the departure (FROM) and arrival (TO) fields are automatically filled.

Note: *The system administrator defines the list of flight numbers and associated characteristics.*

Note: *The flight number must not contain any space (e.g. AIB123 instead of AIB 123).*

Ident.: DSC-46-OIS-20-80-60-10-00015041.0001001 / 02 MAY 14

FROM LIST

The flight crew enters the ICAO code of the departure airport.
The code can be entered via the keyboard, or selected within the drop-down list
The code is automatically filled if the flight crew previously entered the flight number.

Ident.: DSC-46-OIS-20-80-60-10-00015042.0001001 / 02 MAY 14

TO LIST

The flight crew enters the ICAO code of the departure airport.
The code can be entered via the keyboard, or selected within the drop-down list
The code is automatically filled if the flight crew previously entered the flight number.

Ident.: DSC-46-OIS-20-80-60-10-00015036.0001001 / 24 MAY 17

EFB VERSION BUTTON

The system administrator uses the EFB VERSION button to display the configuration of the applications.

Ident.: DSC-46-OIS-20-80-60-10-00016336.0002001 / 24 MAY 17

EFB MESSAGES

The FLT OPS STS page can display the following messages:

 COMPANY COM NOTIFICATION LOST	The notification area cannot display COMPANY COM notifications.
 AVNCS SYNCHRONIZATION NOT AVAIL	The synchronization between the EFB and the avionics is not available.
 CAPT AND F/O SYNCHRONIZATION NOT AVAIL	The synchronization between the CAPT EFB and the F/O EFB is not available.
 SPARE EFB NOT CONNECTED	The spare EFB (EFB3) is not connected to the avionics network, or the spare EFB (EFB3) is OFF.
 SPARE EFB ON BATTERY	The spare EFB (EFB3) is not electrically powered.

Ident.: DSC-46-OIS-20-80-60-10-00023256.0001001 / 03 JUL 20

1

2 ## CLEAR/CLOSE FLIGHT BUTTON

The purpose of the CLEAR/CLOSE FLIGHT button is to reset all EFB applications at the end of the flight.

When the flight crew presses the CLEAR/CLOSE FLIGHT button, all of the following occur:
- A reset of the avionics synchronization
- An export of all items in the EXPORT BOX via all available means (USB key and/or ground connection).

Ident.: DSC-46-OIS-20-80-60-10-00023534.0001001 / 24 MAY 17

DONE BUTTON

When pressed, exits the FLT OPS STS page and displays:
- The LOAD BOX, if no other application was previously accessed, or
- The previously accessed application.

EFB - OPS LIBRARY

OPS LIBRARY

Applicable to: ALL

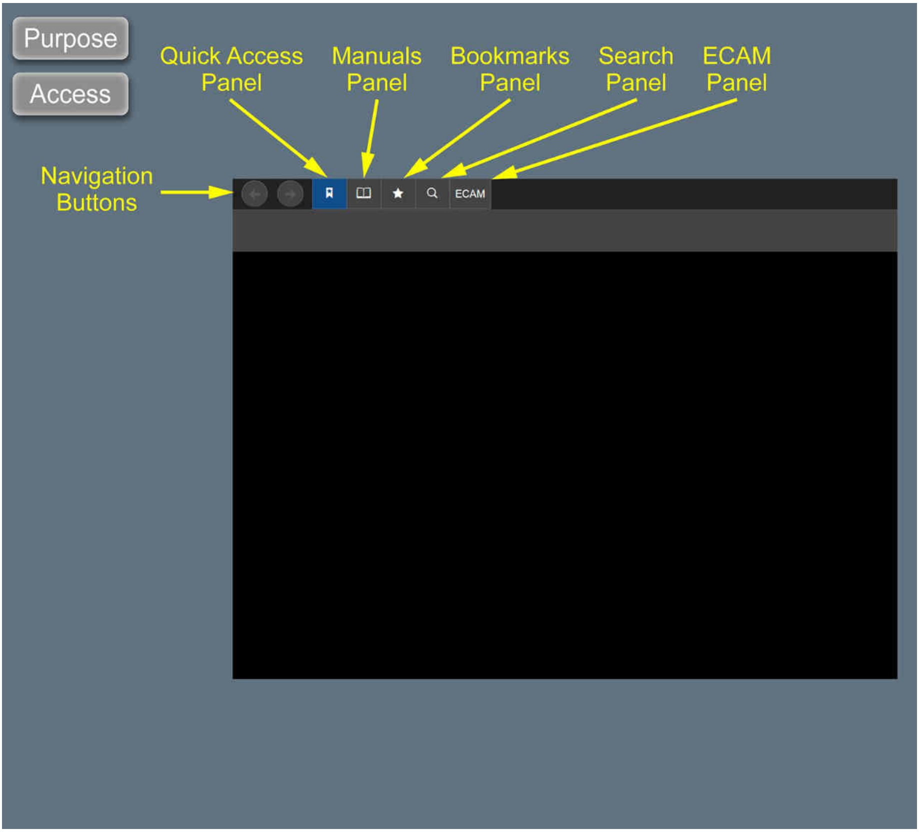
OPS LIBRARY Overview



Purpose
Access
Quick Access Panel
Manuals Panel
Bookmarks Panel
Search Panel
ECAM Panel
Navigation Buttons
ECAM

Ident.: DSC-46-OIS-20-80-70-10-00015114.0001001 / 24 MAY 17

PURPOSE

The OPS LIBRARY Browser (OLB) is an application available on the EFB side that enables the flight crew to access:
- The Flight Crew Operating Manual (FCOM)
- The Flight Crew Techniques Manual (FCTM)
- The Cabin Crew Operating Manual (CCOM)
- The Minimum Equipment List (MEL)
- The Configuration Deviation List (CDL)
- The Weight and Balance Manual (WBM)
- The Airplane Flight Manual (AFM).

In accordance with the Operator policy or as requested by National Authorities, the airline can remove or modify any of these manuals, or add a manual.

Ident.: DSC-46-OIS-20-80-70-10-00015115.0001001 / 24 MAY 17

ACCESS

The flight crew can access the OPS LIBRARY page via the OPS LIBRARY button of:
- The application menu, or
- The FLT OPS MENU, or
- The navigation bar, if the application is already running, or
- The OIS MENU.

Ident.: DSC-46-OIS-20-80-70-10-00016869.0001001 / 24 MAY 17

NAVIGATION BUTTONS

The flight crew can browse the navigation history:

→	When pressed, moves to the next page.
←	When pressed, moves to the previous page.

Ident.: DSC-46-OIS-20-80-70-10-00018883.0001001 / 24 MAY 17

PURPOSE OF QUICK ACCESS

The flight crew can use the quick access panel in order to display predefined chapters.
The quick access panel gives shortcuts to the chapters that need to be quickly or frequently displayed. The system administrator defines the content of the quick access panel.

Ident.: DSC-46-OIS-20-80-70-10-00018884.0001001 / 24 MAY 17

QUICK ACCESS LINKS

The flight crew can press any link in order to quickly display the corresponding chapter.

Ident.: DSC-46-OIS-20-80-70-10-00018885.0001001 / 24 MAY 17

PURPOSE OF MANUALS

The flight crew can use the manuals panel in order to display the documentation. Several manuals can be available in the manuals panel.

Ident.: DSC-46-OIS-20-80-70-10-00015154.0001001 / 24 MAY 17

SETTINGS

When pressed, displays a drop-down list where the flight crew can select the display of complementary information (document reference, revision marks, crew resource management, abbreviations, font size, and help menu).

Ident.: DSC-46-OIS-20-80-70-10-00015155.0001001 / 02 MAY 14

LAYERS BUTTONS

The flight crew can select the appropriate level of information to display.

L2 For more information on the information layers definition, *Refer to GEN FCOM Use and Organization - Information Layers*.

L1 The text in each layer appears on a different colored background.
When the flight crew selects a layer of information, it remains selected during the consultation of several documentary units.

L2 When the layer 2 is selected, the information from layer 1 and layer 2 are displayed.
When the layer 3 is selected, the information from layer 1, layer 2 and layer 3 are displayed.

L1 When the flight crew selects a layer of information that is not available, the highest available layer of information appears. However, the button that the flight crew uses to select the layer remains selected, but is disabled.

Ident.: DSC-46-OIS-20-80-70-10-00015156.0001001 / 24 MAY 17

BOOKMARK STAR

When pressed, the star becomes yellow and creates a bookmark in the bookmarks panel.
When pressed again, the star is grayed over and the bookmark is removed from the bookmarks panel.

Ident.: DSC-46-OIS-20-80-70-10-00015131.0001001 / 24 MAY 17

NAVIGATION BUTTONS

The navigation buttons enable the flight crew to browse the navigation tree.

❯	When pressed, moves to the next documentary unit.
❮	When pressed, moves to the previous documentary unit.

Ident.: DSC-46-OIS-20-80-70-10-00015129.0001001 / 24 MAY 17

PATH AREA

The path area contains the list of parent folder related to the currently selected item (folder or documentary unit).
The flight crew can press any item to open a drop-down list. This drop-down list contains the brothers of the selected item. The flight crew can use this function to quickly move into the structure of the manual.

Ident.: DSC-46-OIS-20-80-70-10-00015140.0001001 / 24 MAY 17

CONTENT AREA

The content area displays the content of documentary units.
Each documentary unit can contain text, illustrations, tables, links, sounds, video.
The end of each technical content is clearly identified by the indication \\END.

Ident.: DSC-46-OIS-20-80-70-10-00018886.0001001 / 24 MAY 17

PURPOSE OF SEARCH

The flight crew can use the search panel in order to search some information in the documentation.

Ident.: DSC-46-OIS-20-80-70-10-00016885.0001001 / 24 MAY 17

SEARCH MODE LIST

The flight crew can select the type of search. The flight crew can also choose to search only in one manual.
When the flight crew modifies the search mode, the search entry field is cleared.

Ident.: DSC-46-OIS-20-80-70-10-00016886.0001001 / 02 MAY 14

SEARCH ENTRY FIELD

The flight crew can enter the information to search.

Ident.: DSC-46-OIS-20-80-70-10-00016887.0001001 / 24 MAY 17

CLEAR SEARCH BUTTON

When pressed, clears the search entry field.

If the search results are displayed, when pressed, clears the search entry field and the search results.

Ident.: DSC-46-OIS-20-80-70-10-00023535.0001001 / 24 MAY 17

CLEAR RESULTS BUTTON

When pressed, clears the search results and the search entry field.

Ident.: DSC-46-OIS-20-80-70-10-00016888.0001001 / 24 MAY 17

CONDITIONS LIST

If the flight crew enters several words into the search entry field, the flight crew can select the search method.

Ident.: DSC-46-OIS-20-80-70-10-00019771.0001001 / 24 MAY 17

RESULTS PATH AREA

The results path area contains the list of parent folders where the searched information was found. At each folder level, the number of documentary units that contain the searched information is indicated between brackets.
The flight crew can press any item of the results path area to open a drop-down list. This drop-down list contains the brothers of the selected item. The flight crew can use this function to quickly move from one search result to another.

Ident.: DSC-46-OIS-20-80-70-10-00019772.0001001 / 24 MAY 17

LIST OF RESULTS

Lists the documentary units that contain the searched information.
Each result displays the title of the documentary unit, a short extract of the documentary unit where the search information appears, and the path to the documentary unit.
When the flight crew presses a search result in the list, the full documentary unit is displayed in the manuals panel with the search results highlighted in yellow.
To return to the list of search results, the flight crew must press the search panel symbol.

Ident.: DSC-46-OIS-20-80-70-10-00018894.0001001 / 24 MAY 17

PURPOSE OF BOOKMARKS

The flight crew can use bookmarks in the documentation. The flight crew uses the bookmarks panel to manage the bookmarks.

Ident.: DSC-46-OIS-20-80-70-10-00016899.0001001 / 24 MAY 17

BOOKMARKS AREA

The bookmarks area displays the list of bookmarked items.

There are two main sections:
- The system administrator manages bookmarks in the AIRLINE section
- The flight crew manages bookmarks in the PILOT section.

When the flight crew presses a bookmark, the corresponding documentary unit is displayed in the manuals panel.

Ident.: DSC-46-OIS-20-80-70-10-00016901.0001001 / 24 MAY 17

RENAME BUTTON

When pressed, the flight crew can rename the selected bookmark.
The rename button is only available from the edit menu.

Ident.: DSC-46-OIS-20-80-70-10-00016902.0001001 / 24 MAY 17

MOVE TO BUTTON

When pressed, a window that contains the tree of bookmark folders appears. The flight crew can select the folder where to move the selected bookmark. The Move To button is available when a bookmark is selected.
The Move To button is only available from the edit menu.

Ident.: DSC-46-OIS-20-80-70-10-00016903.0001001 / 24 MAY 17

DELETE BUTTON

When pressed, deletes the selected bookmark or folder.
The delete button is only available from the edit menu, and when a bookmark or an empty folder is selected.

Ident.: DSC-46-OIS-20-80-70-10-00016904.0001001 / 24 MAY 17

CREATE FOLDER BUTTON

When pressed, creates a new folder as a child of the current folder.
The create folder button is only available from the edit menu.

Ident.: DSC-46-OIS-20-80-70-10-00016906.0001001 / 24 MAY 17

CLEAR BUTTON

When pressed, deletes all the folders and the bookmarks of the PILOT section.
The clear button is only available from the edit menu, and when the PILOT section is selected.

Ident.: DSC-46-OIS-20-80-70-10-00016916.0001001 / 24 MAY 17

EXPORT BUTTON

When pressed, transfers the bookmarks to the EXPORT BOX. The file that is created can then be imported into another laptop.

The export button is only available when the edit menu is not active.

Ident.: DSC-46-OIS-20-80-70-10-00023536.0001001 / 24 MAY 17

IMPORT BUTTON

The flight crew can press the Import button in order to import bookmarks from the LOAD BOX.

Ident.: DSC-46-OIS-20-80-70-10-00018895.0001001 / 24 MAY 17

PURPOSE OF ECAM

The flight crew can use the ECAM panel in order to display the active ECAM alerts and dispatch messages. The flight crew can also display the documentation associated with the ECAM alerts and dispatch messages.

Ident.: DSC-46-OIS-20-80-70-10-00016884.0001001 / 02 MAY 14

ACTIVE ECAM ALERTS & DISPATCH MESSAGES

Indicates the list of active ECAM alerts and dispatch messages.
The history of alerts and dispatch messages is not available.

Ident.: DSC-46-OIS-20-80-70-10-00016908.0001001 / 24 MAY 17

LINK TO FCOM PROCEDURE

When pressed, opens the FCOM procedure associated with the active ECAM alert.

Ident.: DSC-46-OIS-20-80-70-10-00016910.0001001 / 24 MAY 17

LINK TO MEL DISPATCH MESSAGE

When pressed, opens the description of the active dispatch message.

Ident.: DSC-46-OIS-20-80-70-10-00016911.0001001 / 24 MAY 17

LINK TO LIB SEARCH

When pressed, starts a search in all the available manuals.
If the hyperlink is related to an ECAM alert, the search is related to the fault code of the ECAM alert.
If the hyperlink is related to a dispatch message, the search is related to the fault code of the dispatch message.
If the hyperlink is related to an ECAM alert associated with a dispatch message, the search is a OR condition between the fault code of the ECAM alert and the fault code of the dispatch message.

Ident.: DSC-46-OIS-20-80-70-10-00016912.0001001 / 24 MAY 17

SYNCHRO ECAM BUTTON

When pressed, updates the list of active ECAM alerts and dispatch messages.

L2 The list is updated when the panel is displayed (e.g when moving from another panel to the ECAM panel, or moving from another application to the OPS LIBRARY).

L1 The SYNCHRO ECAM button is not available in the case of loss of synchronization with the aircraft avionics.

Ident.: DSC-46-OIS-20-80-70-10-00016907.0001001 / 02 MAY 14

SYNCHRONIZATION LOST MESSAGE

Indicates that the synchronization between OPS LIBRARY and the aircraft avionics is lost. The list of active ECAM alerts and dispatch messages cannot update.

Fuel & Load

Ident.: DSC-46-OIS-20-80-80-10-00018300.0001001 / 02 MAY 14

PURPOSE

The flight crew can use the FLT FOLDER in order to:
- Display the EFFs
- Store information from other EFB applications
- Centralize all the mission-related information
- Monitor and log the progress of the flight
- Send the documents to a ground archiving system.

Ident.: DSC-46-OIS-20-80-80-10-00018301.0001001 / 02 MAY 14

ACCESS

The flight crew can access the FLT FOLDER via:
- The FLT FOLDER selection in the EFB list
- The FLT FOLDER button in the FLT OPS MENU
- The FLT FOLDER button in the navigation area if the application is already open.

Ident.: DSC-46-OIS-20-80-80-10-00018302.0001001 / 02 MAY 14

EFF LIST

The flight crew uses the EFF list in order to select the EFF to display and to set as current.

Ident.: DSC-46-OIS-20-80-80-10-00018303.0001001 / 02 MAY 14

MANAGE BUTTON

The MANAGE button provides the flight crew with functions dedicated to the use of the FLT FOLDER application (e.g: create a new document).

Ident.: DSC-46-OIS-20-80-80-10-00018304.0001001 / 02 MAY 14

SIGN/CHECK BUTTON

The flight crew uses the SIGN/CHECK button in order to electronically sign or check a document.
It is also possible to UNSIGN or UNCHECK a document.

Ident.: DSC-46-OIS-20-80-80-10-00018305.0001001 / 02 MAY 14

NAVIGATION AREA

The flight crew uses the navigation tree to access an EFF.
When starting the application, the navigation tree displays the current EFF. If no current EFF was selected, it will display the first EFF of the EFF list.

CONTENT

The operator can customize the structure of the EFFs.

However, all EFFs contain the following:

- A root folder, which provides the identifier of the EFF, composed of:
  - The flight number
  - The date of flight
  - The departure airport
  - The Destination airport.
- Subfolders, that contain subfolders and/or documents
- Different types of documents:
  - Text documents

    L3 TXT, RTF, PDF, HTML, XML.
  - L1 Graphical documents.

    L3 JPEG, PNG, SVG, GIF.

L1

COLOR CODING FOR DOCUMENTS

Sign Constraint

Authorities and/or the operator's policy may require the flight crew to sign specific documents in an EFF.
When the flight crewmember signs the document, the document name in the navigation tree turns from blue to green.

Check Constraint

The operator's policy may require the flight crew to check specific documents in an EFF.
When the flight crew checks the document, the document name in the navigation tree turns from blue to green.

No Constraint

Documents that do not require a signature or a check appear in white in the navigation tree.

Summary

Color	Indicates
BLUE	Documents that must be signed or checked.
GREEN	Documents that have been flagged as signed or checked.
WHITE	Documents that do not require a signature or a check.

COLOR CODING FOR SUBFOLDERS

The same color code as for document is applied to subfolder names in the navigation tree.

Color	Indicates
BLUE	Subfolders containing one or more documents that must be signed or checked.
GREEN	Subfolders in which all the required actions ('Sign' or 'Check') have been performed.
WHITE	Subfolders with no document that must be signed or checked.

(NEW) INDICATOR

The **(NEW)** indicator before a document name indicates that:
- The document is new
- The flight crew has not read the document.

When the flight crew has read the document, the **(NEW)** indicator is no longer displayed.
If a subfolder contains documents preceded by the **(NEW)** indicator, the **(NEW)** indicator also appears before the subfolder name in the navigation tree. The indicator disappears as soon as the flight crew has read all these documents.

Ident.: DSC-46-OIS-20-80-80-10-00018306.0001001 / 02 MAY 14

DOCUMENT WINDOW

When the flight crew selects a subfolder in the navigation area, the document window displays the list of subfolders and documents inside the selected subfolder.
When the flight crew selects a document in the navigation area, the document window displays the selected document.

PURPOSE

T.O PERF provides optimized takeoff performance calculation for a given airport.

Inputs are divided into three parts:
- Airport and runway
- Conditions
- Aircraft status.

Note: The system administrator customize all parameters relative to units, fleet, and airports.

Ident.: DSC-46-OIS-20-80-90-10-00013399.0001001 / 24 MAY 17

ACCESS

The flight crew can access the T.O PERF application via the T.O PERF button of:
- The application menu, or
- The FLT OPS MENU, or
- The navigation bar, if the application is already running, or
- The OIS MENU.

Ident.: DSC-46-OIS-20-80-90-10-00013432.0001001 / 24 MAY 17

COMPUTE BUTTON

When pressed, displays the performance computation results in the result area.
The COMPUTE button can be pressed only if the application does not detect any error or missing parameter.

Ident.: DSC-46-OIS-20-80-90-10-00013888.0001001 / 24 MAY 17

XCHECK WITH AVNCS BUTTON

The XCHECK WITH AVNCS function enables the flight crew to crosscheck the FMS takeoff performance entries with the OIS takeoff performance results.

Ident.: DSC-46-OIS-20-80-90-10-00013392.0001001 / 24 MAY 17

PURPOSE OF RUNWAY PANEL

The flight crew uses the runway panel to select the takeoff runway used for the computation.

Ident.: DSC-46-OIS-20-80-90-10-00013650.0001001 / 24 MAY 17

RUNWAY LIST

The flight crew can select one or multiple takeoff runway(s) of the selected airport.
When selected, the runway picture is updated.

Only one runway can be selected.

Multiple runways can be selected.

Ident.: DSC-46-OIS-20-80-90-10-00013409.0001001 / 24 MAY 17

AIRPORT LIST

The flight crew can use the airport list to compute the aircraft performance for any airport available in the list.

L2 The system administrator defines the airport list.

L1 If the flight crew selects an airport different from the FLT OPS STS page, all input data are reset to the standard values or cleared after confirmation of the airport change.

Ident.: DSC-46-OIS-20-80-90-10-00013638.0001001 / 06 NOV 14

RUNWAY CHARACTERISTICS AREA

Runway characteristics are:
- Elevation (ELEVN)
- Slope
- Takeoff Run Available (TORA)
- Takeoff Distance Available (TODA)
- Accelerate Stop Distance Available (ASDA)
- Number of obstacles
- Runway entry angle
- T.O shift.

L2 The system administrator can deactivate the T.O shift field.

Ident.: DSC-46-OIS-20-80-90-10-00013719.0001001 / 24 MAY 17

RUNWAY LENGTH REDUCTION AREA

The flight crew can enter the runway length reduction from the RWY start, or the RWY end.

The runway length that is displayed on the runway characteristics area and the runway picture is reduced according to the entered value.
The takeoff shift (T.O SHIFT) that is displayed on the runway characteristics area and the runway picture is increased according to the entered value, if the runway length has been decreased from the runway entry point (RWY START).

L2 The takeoff shift is a reduction of the takeoff distance (TORA, TODA, ASDA) due to a takeoff from an intersection.

L1 The runway panel displays the label "MODIFIED" to indicate that the flight crew has modified the runway length.

L2 If the flight crew reduces the runway length from the RWY end, the length of the clearway and the stopway are automatically set to 0.

Ident.: DSC-46-OIS-20-80-90-10-00013722.0001001 / 24 MAY 17

ADDITIONAL OBSTACLE AREA

The flight crew can add one more obstacle for the selected runway.
The flight crew uses the FROM RWY START or the FROM RWY END entry fields to enter the obstacle longitudinal position.

L2 The value entered in the FROM RWY START entry field must be higher than or equal to the runway TORA.
The additional obstacle is considered on the runway extended centerline (no lateral distance).

L1 The flight crew uses the HEIGHT entry field to enter the obstacle height.
The runway panel displays the label "MODIFIED" to indicate that the flight crew added an obstacle.

Ident.: DSC-46-OIS-20-80-90-10-00013724.0001001 / 24 MAY 17

MODIFY ENTRY ANGLE LIST

The flight crew can modify the runway entry angle via the ENTRY ANGLE list.
The runway entry angle displayed on the runway characteristics area and the runway picture is updated according to the selected value.

Ident.: DSC-46-OIS-20-80-90-10-00018976.0001001 / 24 MAY 17

OBSTACLES TABLE

The obstacles table contains information about the obstacles applicable to the selected runway.

The following obstacles data is displayed:
- Distance from the runway entry point (start of runway area or intermediate taxi crossing intersection)
- Lateral distance from the runway centerline
- Height.

When the flight crew manually adds an obstacle, the associated data is displayed in blue, in the obstacles table.

Ident.: DSC-46-OIS-20-80-90-10-00013389.0002001 / 24 MAY 17

PURPOSE OF CONDITIONS AREA

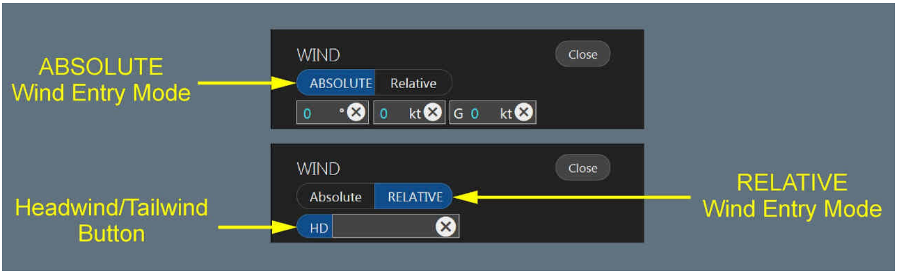
The flight crew uses the conditions area to insert the:
- Wind
- Outside Air Temperature (OAT)
- QNH
- Runway conditions
- Takeoff Weight (TOW)
- Thrust
- Aircraft configuration
- Air conditioning setting
- Anti-ice setting.

Ident.: DSC-46-OIS-20-80-90-10-00013400.0001001 / 24 MAY 17

WIND ENTRY FIELD

Indicates the wind value for performance computation.

The flight crew can select:
- ABSOLUTE, in order to define the wind with a direction/speed/gust combination, or
- RELATIVE, in order to define the wind with a longitudinal speed component only (headwind or tailwind).



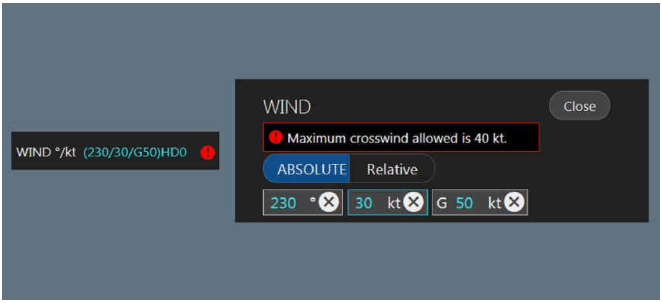
ABSOLUTE
Wind Entry Mode
WIND
Close
ABSOLUTE
Relative
0 °
0 kt
G 0 kt
WIND
Close
Absolute
RELATIVE
HD
RELATIVE
Wind Entry Mode
Headwind/Tailwind
Button

The application displays a wind sock on the side of the runway picture. For more information on the runway picture, *Refer to DSC-46-OIS-20-80-90 Runway Picture*.

Note: *The computation of the crosswind component takes into account the gust value (used to check the maximum crosswind limitation). The computation of the longitudinal wind component takes into account the steady wind speed only.*

The application crosschecks the crosswind and tailwind components with the limitations of the aircraft, and in accordance with the selected runway condition.

Depending on the administrator setting, if the entered wind exceeds the crosswind or tailwind limitation, the following occurs:
- The flight crew cannot run the computation, or
- The flight crew can run the computation, after confirmation by a pop-up message.



WIND °/kt (230/30/G50)HD0

Maximum crosswind allowed is 40 kt.

230 ° | 30 kt | G 50 kt

L2 For more information about the crosswind limitation, *Refer to LIM-AG-OPS Maximum Crosswind for Takeoff and Landing*, and *Refer to LIM-AG-OPS Maximum Tailwind for Landing*.

Ident.: DSC-46-OIS-20-80-90-10-00013401.0001001 / 24 MAY 17

OAT ENTRY FIELD

Indicates the Outside Air Temperature (OAT) at the airport.
The flight crew manually enters the temperature.
If the flight crew entered the QNH via the QNH entry field, the temperature deviation from the International Standard Atmosphere (ISA) is automatically computed and displayed.

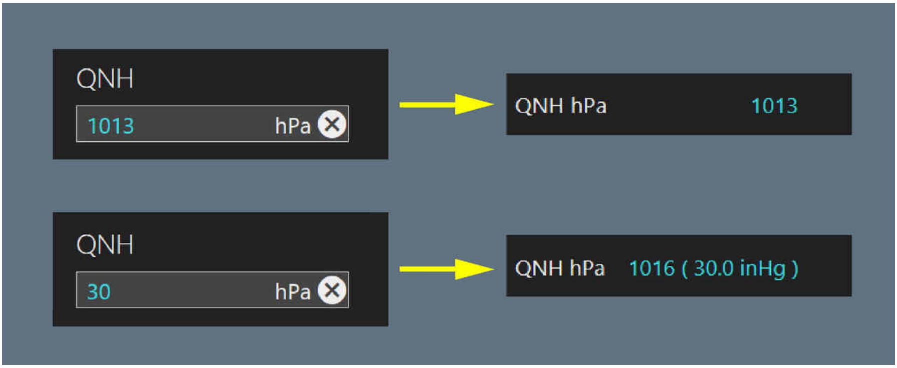
Note: *The OAT range depends on the selected runway condition.*

Ident.: DSC-46-OIS-20-80-90-10-00013402.0001001 / 24 MAY 17

QNH ENTRY FIELD

Indicates the sea level atmospheric pressure.
The flight crew enters the value of the QNH. The application automatically detects the unit (hPa or inHg).

QNH Format



Ident.: DSC-46-OIS-20-80-90-10-00013403.0001001 / 02 MAY 14

RWY COND LIST

Indicates the runway surface condition.
The runway surface condition affects takeoff performance and must be taken into account for MTOW(perf) calculation.

Ident.: DSC-46-OIS-20-80-90-10-00013404.0001001 / 02 MAY 14

A-ICE LIST

Indicates the anti-ice setting for takeoff.

Ident.: DSC-46-OIS-20-80-90-10-00013405.0001001 / 24 MAY 17

TOW ENTRY FIELD

Indicates the Takeoff Weight (TOW) of the aircraft.

The flight crew can manually:
- Enter the desired TOW value, or
- Use the shortcut “*” to obtain the structural TOW.

It is possible to enter a weight that is higher than the certified MTOW. The results will be displayed for the entered weight, regardless of the MTOW.

COMMUNICATION FROM LOADSHEET TO T.O PERF

The T.O PERF application can get back the TOW value from the results of the LOADSHEET application. In this case, the TOW value is displayed in yellow in the conditions area.

Ident.: DSC-46-OIS-20-80-90-10-00013406.0001001 / 02 MAY 14

CONF LIST

Indicates the aircraft flap setting selected for the computation.

When OPT CONF is selected, the computation returns the takeoff configuration that maximizes:
- The MTOW(perf) if the takeoff is limited by the performance, or
- The flexible temperature if a flexible takeoff is possible.

L2 For more information about takeoff configurations,*Refer to DSC-27-20-20 Configurations*

Ident.: DSC-46-OIS-20-80-90-10-00013407.0001001 / 24 MAY 17

AIR COND LIST

Indicates the air conditioning setting.

Ident.: DSC-46-OIS-20-80-90-10-00013408.0001001 / 03 JAN 19

THRUST LIST

Indicates the thrust option for takeoff.

The flight crew selects the thrust option from the THRUST option list:
- Maximum takeoff thrust (TOGA)
- Flexible thrust (FLEX)
- Derated level
- Optimum thrust.

The use of a specific option depends on the outside conditions.

L2 For more information about thrust options:
- TOGA: *Refer to PER-TOF-20-10 TOGA Thrust*
- FLEX: *Refer to PER-TOF-20-20-20 Flexible Takeoff Limitations*
- Derated: *Refer to PER-TOF-20-20-30 Derated Takeoff Limitations*.

L1

CAUTION	In the case of a MEL item that forbids the use of FLEX or derated takeoff thrust, FLEX and derate level thrust options are still available in T.O PERF, even though it is forbidden by the procedure. In this case, the flight crew must select TOGA thrust option.

Ident.: DSC-46-OIS-20-80-90-10-00013559.0001001 / 24 MAY 17

PURPOSE OF AIRCRAFT STATUS AREA

The aircraft status enables the selection and display of MEL items and CDL items that affect the takeoff performance.
The T.O PERF application receives the list of MEL and CDL items that the flight crew selected in the OPS LIBRARY application.
The flight crew can also manually add or remove MEL and CDL items.

Ident.: DSC-46-OIS-20-80-90-10-00014777.0001001 / 02 MAY 14

AIRCRAFT STATUS PANEL

The Aircraft Status Panel displays the MEL and CDL items. The status is retrieved from the aircraft avionics, and the flight crew can manually insert additional MEL and CDL items.

L2 The flight crew can keep the cursor over the aircraft status panel in order to increase the size of the window.

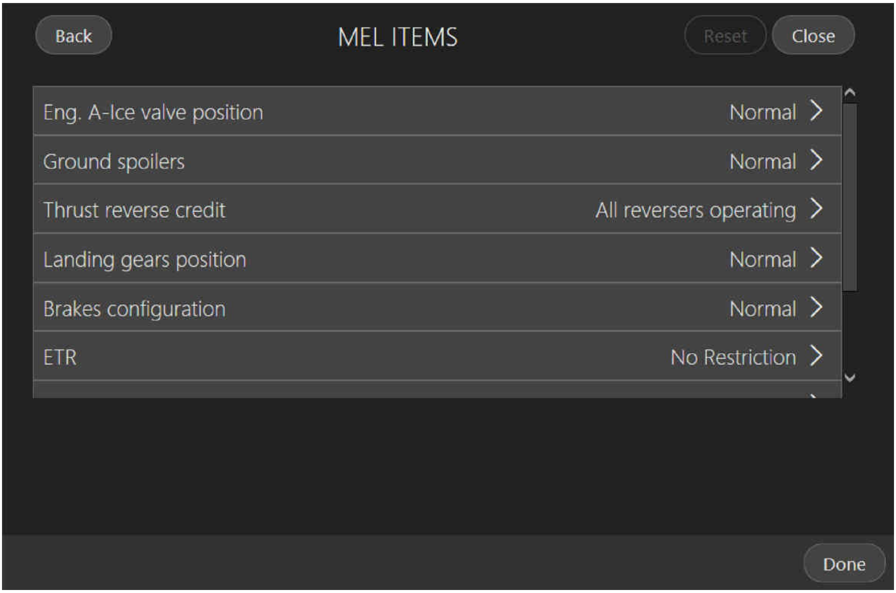
L1 If the aircraft is dispatched without any MEL or CDL item that affects takeoff performance, "NORMAL" appears.

Ident.: DSC-46-OIS-20-80-90-10-00013419.0001001 / 24 MAY 17

MEL ITEMS

Indicates the number of active MEL items that the application takes into account for performance computation.
The OPS LIBRARY application sends the list of ticked MEL items to the T.O PERF application.
The flight crew can also manually insert the inoperative systems of the aircraft that cause performance penalties via the MEL ITEMS panel.
When pressed, displays the MEL ITEMS panel where the flight crew can manually select inoperative systems that affect the takeoff performance.

MEL ITEMS Panel



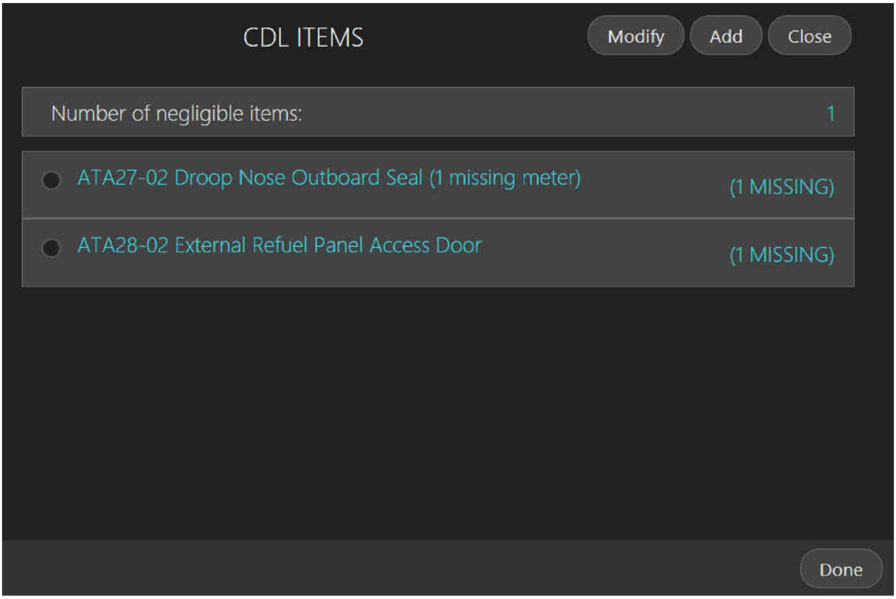
Eng. A-Ice valve position	Normal
Ground spoilers	Normal
Thrust reverse credit	All reversers operating
Landing gears position	Normal
Brakes configuration	Normal
ETR	No Restriction

Ident.: DSC-46-OIS-20-80-90-10-00013417.0001001 / 03 JUL 20

1 CDL ITEMS

Indicates the number of active CDL items and negligible items that the application takes into account for performance computation.
The flight crew can also manually insert the missing structural parts of the aircraft that cause performance penalties via the CDL ITEMS panel.
When pressed, it displays the CDL ITEMS panel where the flight crew can manually select missing items or missing meters that affect takeoff performance.

L2 Negligible items are missing structural parts that have a negligible impact on performance when not combined with others. The application takes into account the number of negligible items in order to apply the appropriate performance penalty.



Number of negligible items: 1

● ATA27-02 Droop Nose Outboard Seal (1 missing meter) (1 MISSING)

● ATA28-02 External Refuel Panel Access Door (1 MISSING)

Ident.: DSC-46-OIS-20-80-90-10-00013831.0001001 / 24 MAY 17

PURPOSE OF RESULTS AREA

The results area displays the performance computation outputs.
The system administrator can customize the list of outputs.

Two functions are available:
- In case of single runway computation, one result is available
- In case of multiple runway computation, one result per selected runway is available.

Ident.: DSC-46-OIS-20-80-90-10-00013867.0001001 / 24 MAY 17

MTOW(PERF)

The MTOW(perf) field of the results area indicates the maximum takeoff weight limited by performance.
The MTOW(perf) value may exceed the certified MTOW value. However, the real takeoff weight must not exceed MTOW.
If TOW is higher than MTOW(perf), the results are red and dashed.
L2 For more information about MTOW, *Refer to LIM-AG-WGHT Weight Limitations*.

Ident.: DSC-46-OIS-20-80-90-10-00013883.0001001 / 24 MAY 17

STOP MARGIN

The stop margin is the difference between the available runway length and the computed ASD.

Ident.: DSC-46-OIS-20-80-90-10-00013877.0001001 / 02 MAY 14

LIMITATION

Takeoff limitations are regulatory requirements to limit takeoff performance.
The takeoff limitations are identified in the RESULTS area via limitation codes.
Usually, the best takeoff performance is obtained at the intersection of two limitation curves. For this reason, the limitation codes are indicated by two codes.
The two codes are identical if the takeoff performance is only determined by one limitation.
The following table indicates the various codes that can appear:

Code	Description
TOW	Maximum computation weight, or maximum structural weight.
RWY0	All-engine Takeoff Distance (TOD0)
	or All-engine Takeoff Run (TOR0)
	or All-engine Accelerate Stop Distance (ASD0)
RWY1	One- engine Inoperative Takeoff Distance (TOD1)
	or One-engine Inoperative Takeoff Run (TOR1)
	or One-engine Inoperative Accelerate Stop Distance (ASD1)
VMCG	V1 limited by certified minimum control speed on ground
TIRE	VLOF limited by maximum tire speed
BRK	V1 limited by maximum brake energy
VMCA	V2 limited by certified minimum control speed in the air
1SEG	First segment climb gradient
2 SEG	Second segment climb gradient
3 SEG	Acceleration (third) segment
FTO	Final takeoff climb gradient
OBS	Obstacle clearance
VMU	Minimum unstick speed

Customized codes may differ from the above listed.

Ident.: DSC-46-OIS-20-80-90-10-00013881.0001001 / 24 MAY 17

TAKEOFF SPEEDS

T.O PERF displays the following takeoff speeds on the RESULTS area:
- V1, the decision speed
- VR, the rotation speed
- V2, the minimum takeoff climb speed.

L2 For more information on V1, *Refer to DSC-22-27-10-20 V1*.

For more information on VR, *Refer to DSC-22-27-10-20 VR*.
For more information on V2, *Refer to DSC-22-27-10-20 V2*.

L1 The following two display modes of V1 are possible, depending the system administrator settings.

SINGLE V1

T.O PERF displays only one V1 value that can correspond to:
- V1 min, or
- V1 max, or
- V1 mean.

V1 RANGE

T.O PERF displays a range of possible V1 values, from V1 min to V1 max. The flight crew can select the V1 value to be used for takeoff within the [V1 min ; V1 max] range, via "-"/"+" buttons.

Ident.: DSC-46-OIS-20-80-90-10-00013882.0001001 / 24 MAY 17

FLAPS/SLATS CONFIGURATION

The CONF field on the results area displays the selected or optimized configuration.
The optimization process selects the configuration that provides the maximum performance limited takeoff weight (or the maximum TFLEX). If the weight is the same for several configurations, the configuration that provides the lowest takeoff speeds is selected.

Ident.: DSC-46-OIS-20-80-90-10-00013885.0001001 / 24 MAY 17

THRUST

Depending on the thrust option selected by the flight crew in the conditions area, the thrust label displayed in the results area may be:
- The selected thrust option, if TOGA or a derate level is selected
- An optimum derate level, FLEX or TOGA, if OPTIMUM THRUST is selected
- An adapted thrust to the actual takeoff weight, if FLEX is selected.

L2 For more information about thrust options:
- TOGA: *Refer to PER-TOF-20-10 TOGA Thrust*
- FLEX: *Refer to PER-TOF-20-20-20 Flexible Takeoff Definition*
- Derated: *Refer to PER-TOF-20-20-30 Derated Takeoff Definition*.

Ident.: DSC-46-OIS-20-80-90-10-00013886.0001001 / 24 MAY 17

ENG OUT ACC

The ENG OUT ACC field in the results area displays the computed engine-out acceleration altitude value.

T.O PERF application calculates the minimum and maximum acceleration heights:
- Minimum ENG OUT ACC height: The highest of the minimum regulatory value (400 ft) and the obstacle clearance
- Maximum ENG OUT ACC height: The maximum height determined by the 10 min takeoff thrust limitation to reach the en-route configuration.

The system administrator defines a Standard ENG OUT ACC height.

The displayed ENG OUT ACC altitude is selected as follows:
- If the Standard ENG OUT ACC height is between min and max ENG OUT ACC height, then the result displayed in T.O PERF is the Standard ENG OUT ACC altitude
- If the Standard ENG OUT ACC height is below min ENG OUT ACC height, then the result displayed in T.O PERF is min ENG OUT ACC altitude
- If the Standard ENG OUT ACC height is above max ENG OUT ACC height, then the result displayed in T.O PERF is max ENG OUT ACC altitude.

Ident.: DSC-46-OIS-20-80-90-10-00023686.0001001 / 24 MAY 17

REV FOR COMPUTATION

The REV FOR COMPUTATION field displays the thrust reverser status for the T.O PERF computation:
- For dry runways, there is no reverse thrust credit
- For wet and contaminated runways, the thrust reverser status is defined by the system administrator.

Ident.: DSC-46-OIS-20-80-90-10-00023727.0001001 / 24 MAY 17

RESULTS AREA - PERF T.O PAGE

Displays the outputs as they should be entered in the MFD - PERF T.O page.

L2 For more information on the MFD - PERF T.O page, *Refer to DSC-22-FMS-20-20-20 PERF Page*.

Ident.: DSC-46-OIS-20-80-90-10-00023728.0001001 / 24 MAY 17

DETAILED RESULTS

Displays the list of detailed results.

Note: The system administrator defines the list.

Ident.: DSC-46-OIS-20-80-90-10-00013727.0001001 / 24 MAY 17

CLEAR BUTTON

When pressed, resets the inputs of the T.O PERF application to the default values.

Ident.: DSC-46-OIS-20-80-90-10-00023683.0001001 / 24 MAY 17

CLOSE BUTTON

When pressed, cancels and closes the entries and returns to the T.O PERF application.

Ident.: DSC-46-OIS-20-80-90-10-00023684.0001001 / 24 MAY 17

RESTORE BUTTON

When pressed, restores the initial values of the fields that the flight crew modified and returns to the previous view.

Ident.: DSC-46-OIS-20-80-90-10-00023685.0001001 / 24 MAY 17

DONE BUTTON

When pressed, validates the entry.

Ident.: DSC-46-OIS-20-80-90-10-00024021.0001001 / 24 MAY 17

RUNWAY PICTURE

The runway picture corresponds to the selected runway, with the associated Takeoff Runway Available (TORA) on the runway centerline.

L2 The dark grey area corresponds to the TORA that includes user modifications. The unusable parts of the runway are displayed in light grey. If applicable, the displaced threshold is displayed.

L1 After computation of the takeoff performance, the following results are displayed on the runway picture:

- The Acceleration Stop Distance (ASD), *Refer to ASD*
- The Stop Margin, *Refer to Stop Margin*

Ident.: DSC-46-OIS-20-80-90-10-00024022.0001001 / 24 MAY 17

ASD

The ASD corresponds to the accelerate stop distance calculated according to the forecasted conditions.

Ident.: DSC-46-OIS-20-80-90-10-00024023.0001001 / 24 MAY 17

WIND SOCK

The wind sock indicates the wind direction relative to the runway.

L2 If the flight crew entered the wind as a direction and speed combination, both the crosswind and longitudinal wind components are displayed. If the flight crew only entered the longitudinal wind component, the crosswind component cannot be computed.

Ident.: DSC-46-OIS-20-80-90-10-00024024.0001001 / 24 MAY 17

ENTRY ANGLE

The entry angle value is displayed on the runway picture.

Ident.: DSC-46-OIS-20-80-90-10-00024025.0001001 / 24 MAY 17

BLUE BAR

A blue bar indicates the brake release point.

FULL	The brake release point is the runway start.
MOD	The brake release point is the modified ("FROM RUNWAY START" is different from zero) when the brake release point is the runway start or the taxiway entry.
-M10	The brake release point is the taxiway entry. The last four digits of the taxiway entry are written on the blue bar (e.g. Computation from taxiway -M10 entry).

All fields must be completed to compute your in-flight performance data

Ident.: DSC-46-OIS-20-80-100-10-00013819.0001001 / 24 MAY 17

PURPOSE

The IN-FLT PERF application provides optimized in-flight performance calculation for different phases of the flight.

Note: *The system administrator can customize all parameters relative to units, Operator fleet, and airport data.*

The IN-FLT PERF application includes six different tabs:
- Flight planning (PLAN)
- Climb (CLB)
- Cruise (CRZ)
- Descent with engine inoperative (DES OEI)
- Hold (HLD)
- Atmosphere (ATMO).

Note: *There is no communication between the LOADSHEET application and the IN-FLT PERF application.*

Ident.: DSC-46-OIS-20-80-100-10-00013821.0001001 / 24 MAY 17

ACCESS

The flight crew can access the IN-FLT PERF application via the IN-FLT PERF button of:
- The application menu, or
- The FLT OPS MENU, or
- The navigation bar, if the application is already running, or
- The OIS menu.

Ident.: DSC-46-OIS-20-80-100-10-00013830.0001001 / 02 MAY 14

ERROR MANAGEMENT AREA

Indicates the missing parameters or the out of range values.
The Error Management Area is displayed on top of the RESULTS area.

COMPUTE BUTTON

When pressed, displays the performance computation results in the RESULTS area.

Ident.: DSC-46-OIS-20-80-100-10-00013828.0001001 / 24 MAY 17

CLEAR BUTTON

When pressed, resets the inputs of the IN-FLT PERF application to the default values.

Ident.: DSC-46-OIS-20-80-100-10-00023920.0001001 / 24 MAY 17

MODIFY BUTTON

When pressed, enables the modification of the parameters of the conditions area and the aircraft status.

Ident.: DSC-46-OIS-20-80-100-10-00013829.0001001 / 02 MAY 14

IN-FLT PERF MESSAGES AREA

The IN-FLT PERF messages area can indicate :
- Help messages, or
- Valid range, format and units for the inputs.

Ident.: DSC-46-OIS-20-80-100-10-00023919.0001001 / 24 MAY 17

IN-FLT PERF DIAGRAM

Highlights in blue the flight phase that corresponds to the IN-FLT PERF tab currently selected.

Ident.: DSC-46-OIS-20-80-100-10-00013427.0001001 / 24 MAY 17

PURPOSE OF CONDITIONS

The flight crew uses the conditions area to:
- Enter the weather
- Select the number of operative engines
- Select the loading characteristics of the aircraft
- Define the in-flight performance strategy.

Ident.: DSC-46-OIS-20-80-100-10-00018344.0001001 / 24 MAY 17

WIND ENTRY FIELD

Indicates the wind for performance computation.

The flight crew can define the wind value with:
- A direction/speed combination, or
- A longitudinal component.

If the flight crew defines the wind with a direction/speed combination, the longitudinal wind component is automatically calculated when the HDG entry field is filled in.

Ident.: DSC-46-OIS-20-80-100-10-00018345.0001001 / 24 MAY 17

TEMP ENTRY FIELD

Indicates the ISA deviation.

The flight crew can enter the temperature as:
- An ISA deviation, or
- A Static Air Temperature (SAT) at the initial altitude, that is automatically converted into an ISA deviation.

L2 When the flight crew enters an ISA deviation, the application computes and displays the equivalent SAT at initial altitude.

Ident.: DSC-46-OIS-20-80-100-10-00018346.0001001 / 02 MAY 14

A-ICE LIST

Indicates the anti-ice setting.
L2 For more information on ice protection, *Refer to Ice Protection*.

Ident.: DSC-46-OIS-20-80-100-10-00018347.0001001 / 24 MAY 17

GROSS WEIGHT ENTRY FIELD

Indicates the gross weight for performance computation.
The flight crew must enter the real gross weight of the aircraft at the beginning of the selected flight phase.

Ident.: DSC-46-OIS-20-80-100-10-00020789.0001001 / 24 MAY 17

INIT WEIGHT ENTRY FIELD

Indicates the weight of the aircraft taken into account for performance computation.

IN PLAN MODE

The flight crew must enter the weight of the aircraft according to the computation type:
- FLIGHT PLAN: The flight crew enters the aircraft weight at engine start
- IN CRUISE: The flight crew enters the current aircraft weight
- ALTERNATE: The flight crew enters the aircraft weight at go-around.

For more information about the computation type, *Refer to DSC-46-OIS-20-80-100 COMPUTATION TYPE List [PLAN]*.

Ident.: DSC-46-OIS-20-80-100-10-00018348.0001001 / 24 MAY 17

CG ENTRY FIELD

Indicates the Center of Gravity (CG) position for performance computation.
The flight crew must enter the CG of the aircraft at the beginning of the selected flight phase.

Ident.: DSC-46-OIS-20-80-100-10-00020790.0001001 / 24 MAY 17

AVERAGE CG ENTRY FIELD

Indicates the average CG position for the flight.

The flight crew must enter an average position of the CG for the flight.

Ident.: DSC-46-OIS-20-80-100-10-00018350.0001001 / 06 NOV 14

AIR COND LIST

Indicates the air conditioning setting, with FWD cargo cooling off.

L2 When the FWD cargo cooling is active, the flight crew applies the following equivalences.

ENG OPERATIVE	AIR FLOW Selector	FWD Cargo Cooling	IN-FLT PERF AIR COND setting
2	LO	ON	NORM
	NORM		HI
	HI		HI
1	LO	ON	LO
	NORM		NORM
	HI		HI

Ident.: DSC-46-OIS-20-80-100-10-00018351.0001001 / 24 MAY 17

HDG ENTRY FIELD

Indicates the heading of the aircraft during the selected flight phase.
The HDG entry field only appears when the flight crew enters the wind as a direction/speed combination.
The flight crew must enter the heading and the wind direction in the same reference (magnetic or true).

Ident.: DSC-46-OIS-20-80-100-10-00013923.0001001 / 02 MAY 14

PURPOSE OF THE CLIMB DATA

The flight crew uses the CLIMB DATA area to enter the climb profile and the engines status.

Ident.: DSC-46-OIS-20-80-100-10-00013925.0001001 / 24 MAY 17

INIT ALT ENTRY FIELD [CLB]

Indicates the initial altitude of the climb.

L2 The initial altitude defines the altitude at which the computation of the initial climb or step climb begins.

Ident.: DSC-46-OIS-20-80-100-10-00013926.0001001 / 24 MAY 17

TRGT ALT ENTRY FIELD [CLB]

Indicates the altitude target of the climb.

L2 The target altitude defines the altitude at which the computation stops.
If the target altitude is above the computed climb ceiling, the computation stops at the climb ceiling.

Ident.: DSC-46-OIS-20-80-100-10-00013959.0001001 / 24 MAY 17

FUEL FACTOR ENTRY FIELD

Indicates the fuel factor.
The fuel factor is defined as a percentage of increase or decrease of the fuel flow. The system administrator defines the fuel factor in order to adjust the in-flight performance of each aircraft.
The flight crew may only modify the fuel factor if the fuel factor is not up to date. The flight crew may only increase the fuel factor.
In the case of a fuel consumption increase associated to a MEL item, a CDL item, or an in-flight failure, the flight crew must not use the FUEL FACTOR field and must use the FUEL PENALTY FACTOR via the NON STD CONF button of the ACFT STS area (*Refer to DSC-46-OIS-20-80-100 Aircraft Status Panel*).

Ident.: DSC-46-OIS-20-80-100-10-00013957.0001001 / 24 MAY 17

ENG OPERATIVE LIST

Indicates the number of operative engines.
If the flight crew selects one engine operative, the THRUST list/indication is automatically set to MCT.

Ident.: DSC-46-OIS-20-80-100-10-00013958.0001001 / 24 MAY 17

THRUST LIST

Indicates the thrust setting for the climb.

The flight crew can select one of the following thrust setting:
- Derated climb (AUTO DERATE), or
- Climb thrust (CL), or
- Maximum Continuous Thrust (MCT).

If the flight crew selects one engine operative from the ENG OPERATIVE list, the thrust setting is automatically set to MCT and cannot be modified.

L2 For more information about thrust settings:
- CL: *Refer to PER-IFT-20-10-20 Maximum Climb Thrust*
- Derate: *Refer to PER-IFT-20-10-20 Auto-Derated Climb Thrust*.

Ident.: DSC-46-OIS-20-80-100-10-00023882.0001001 / 24 MAY 17

CLB TYPE LIST AND ASSOCIATED PARAMETERS

Indicates the type of climb for performance computation.

The flight crew can select one of the following climb strategies:
- OPEN (CI), associated with a Cost Index (CI) and a speed limitation, or
- SELECTED SPEEDS, associated with a Mach or speed value and a speed limitation, or
- GREEN DOT SPD.

If the flight crew selects one engine inoperative from the ENG OPERATIVE list, the CLB TYPE is automatically set to GREEN DOT SPD and cannot be modified.

Ident.: DSC-46-OIS-20-80-100-10-00014998.0001001 / 24 MAY 17

RESULTS AREA [CLB]

The RESULTS area displays a graph with the flight profile.

Every 5 000 ft is indicated:
- The fuel burnt
- The standard altitude
- The CAS and Mach
- The rate of climb
- The N1 setting.

The Recommended Maximum (REC MAX) altitude, and the FMS PERF factor are also indicated.
L2 The IN-FLT PERF application takes into account the FMS PERF factor for accurate performance computation. The flight crew can crosscheck the FMS PERF factor on the DATA/STATUS page of the MFD.
For more information about the FMS PERF factor, *Refer to DSC-22-FMS-10-50-70 PERF Factor and IDLE Factor*.

Ident.: DSC-46-OIS-20-80-100-10-00018353.0001001 / 02 MAY 14

PURPOSE OF CRUISE DATA

The flight crew uses the CRUISE DATA area to define the cruise strategy, and the engines status.

Ident.: DSC-46-OIS-20-80-100-10-00018354.0001001 / 24 MAY 17

SPD TYPE LIST AND ASSOCIATED PARAMETER [CRZ/PLAN]

Indicates the type of cruise.

The flight crew selects the cruise type from the SPD TYPE list:
- ECON (CI), associated with a Cost Index (CI), or
  L2 For more information about the CI, *Refer to PER-IFT-20-20-10 Economic Mach Number (ECON Mach)*.
- L1 Fixed Speed, associated with a Mach or speed value, or

- Long Range Cruise (LRC) speed, or

L2 For more information about LRC, *Refer to PER-IFT-20-20-10 Long Range Cruise Speed (LRC)*.

L1 - Turbulence Speed (PLAN mode only), associated with a Mach value.

Ident.: DSC-46-OIS-20-80-100-10-00018357.0001001 / 24 MAY 17

THRUST INDICATION

Indicates the thrust lever position for the selected flight phase.

Note: *The thrust depends on the number of operative engines.*

Ident.: DSC-46-OIS-20-80-100-10-00018359.0001001 / 24 MAY 17

BUFFET MARGIN INDICATION

For all engine operations, the buffet margin is 1.3 g. If the flight crew selects the Turbulence computation, the buffet margin is increased to 1.4 g.
The buffet margin is used to determine the buffet ceiling.

Ident.: DSC-46-OIS-20-80-100-10-00018360.0001001 / 02 MAY 14

PURPOSE OF ALT RULE [CRZ]

The ALT RULE area enables the flight crew to define the cruise altitude, and the altitude rule (ICAO EVEN, ICAO ODD, RVSM EVEN, etc). This altitude rule is used to propose appropriate step climb altitudes and specific range equivalence altitudes in the RESULTS Area.

Ident.: DSC-46-OIS-20-80-100-10-00023903.0001001 / 24 MAY 17

CRZ ALT ENTRY FIELD

Indicates the cruise level for the performance computation.

Ident.: DSC-46-OIS-20-80-100-10-00018355.0001001 / 24 MAY 17

RESULTS AREA [CRZ]

The RESULTS area displays the performance computation results for the cruise in one or several of the following tables.

FUEL TABLE

Displays the following parameters:
- The all-engine fuel flow
- The fuel flow per engine
- The N1 setting
- The FMS PERF factor.

L2 The IN-FLT PERF application takes into account the FMS PERF factor for accurate performance computation. The flight crew can crosscheck the FMS PERF factor on the DATA/STATUS page of the MFD.
For more information about the FMS PERF factor, *Refer to DSC-22-FMS-10-50-70 PERF Factor and IDLE Factor*.

L1 **ALT TABLE**

Displays the REC MAX and optimum altitudes, together with the associated Mach.

SPEED TABLE

Displays the Mach and CAS for the selected cruise altitude and conditions, in accordance with the selected type of cruise.

Ident.: DSC-46-OIS-20-80-100-10-00013826.0001001 / 02 MAY 14

PURPOSE OF DESCENT DATA

The flight crew uses the DESCENT DATA area to enter the descent profile and the engines status.

Ident.: DSC-46-OIS-20-80-100-10-00013827.0001001 / 24 MAY 17

DES TYPE LIST

Indicates the type of descent.

The flight crew can select:
- OBSTACLE, for a descent with obstacle constraints, or
- EO STANDARD, for a descent without obstacle constraints.

Ident.: DSC-46-OIS-20-80-100-10-00013894.0001001 / 02 MAY 14

INIT ALT ENTRY FIELD [DES]

Indicates the initial altitude of the descent.
L2 The initial altitude defines the altitude at which the computation of a descent or step descent begins.

Ident.: DSC-46-OIS-20-80-100-10-00023923.0001001 / 24 MAY 17

SPD TYPE LIST AND ASSOCIATED PARAMETER [DES]

Indicates the speed type for the descent.

The flight crew selects the speed type from the SPD TYPE list:
- Green Dot, or
- Fixed Speed, associated with a Mach or speed value.

Ident.: DSC-46-OIS-20-80-100-10-00013895.0001001 / 02 MAY 14

TRGT ALT ENTRY FIELD [DES]

Indicate the target altitude of the descent.
L2 The target altitude defines the altitude at which the computation should stop.
For obstacle computation, the computation stops at the level off altitude.

Ident.: DSC-46-OIS-20-80-100-10-00013896.0001001 / 24 MAY 17

SPD BRK LIST

The flight crew can select one of the following speed brakes position for the descent:
- Fully retracted, or
- Fully extended.

Ident.: DSC-46-OIS-20-80-100-10-00013897.0001001 / 24 MAY 17

RESULTS AREA [DES]

The RESULTS area displays a graph with the flight profile.

Every 5 000 ft is indicated:
- The fuel burnt
- The descent gradient
- The N1 setting.

The EO LRC ceiling, and FMS performance factor are also indicated.
L2 The IN-FLT PERF application takes into account the FMS PERF factor for accurate performance computation. The flight crew can crosscheck the FMS PERF factor on the DATA/STATUS page of the MFD.
For more information about the FMS PERF factor, *Refer to DSC-22-FMS-10-50-70 PERF Factor and IDLE Factor*.

Ident.: DSC-46-OIS-20-80-100-10-00013898.0001001 / 02 MAY 14

PURPOSE OF HOLDING DATA

The flight crew uses the HOLDING DATA area to enter the holding strategy, the computation type, and the engine status.

Ident.: DSC-46-OIS-20-80-100-10-00013899.0001001 / 02 MAY 14

ALT ENTRY FIELD

Indicates the altitude of the holding pattern.

Ident.: DSC-46-OIS-20-80-100-10-00013911.0001001 / 24 MAY 17

COMPUTATION TYPE INDICATION [HLD]

The computation type is set to FUEL and cannot be modified.

The FUEL computation type enables the computation of the required fuel for a given holding time.

Ident.: DSC-46-OIS-20-80-100-10-00023955.0001001 / 24 MAY 17

HOLDING TIME ENTRY FIELD

Indicates the holding time that the application takes into account to compute the corresponding fuel consumption.
The flight crew must enter the holding time in minutes.

Ident.: DSC-46-OIS-20-80-100-10-00013912.0001001 / 24 MAY 17

SPD TYPE [HLD]

The flight crew can select one of the following speeds:

- GD Speed, or
L2 For more information about green dot speed,*Refer to DSC-22-27-10-20 GREEN DOT*.
- L1 S Speed.

Note: The system administrator can add a speed increment for holding at green dot. The flight crew can not change the speed increment.

Ident.: DSC-46-OIS-20-80-100-10-00013921.0001001 / 24 MAY 17

RESULTS AREA [HLD]

The RESULTS area displays the performance computation results for the hold in two tables.

FUEL TABLE

Displays the following parameters:

- The fuel burnt during the hold
- The average fuel flow
- The fuel flow per engine
- The N1 setting
- The FMS PERF factor.

L2 The IN-FLT PERF application takes into account the FMS PERF factor for accurate performance computation. The flight crew can crosscheck the FMS PERF factor on the DATA/STATUS page of the MFD.
For more information about the FMS PERF factor, *Refer to DSC-22-FMS-10-50-70 PERF Factor and IDLE Factor*.

L1 WEIGHT TABLE

Displays the aircraft gross weight at the end of the hold.

Ident.: DSC-46-OIS-20-80-100-10-00013922.0001001 / 24 MAY 17

AVERAGE WIND ENTRY FIELD

Indicates the average wind during the desired flight phase for the performance computation.

The flight crew can define the wind with:
- A direction/speed combination, or
- A headwind (HD), or tailwind (TL) component.

L2 If the flight crew defines the wind direction, the application automatically displays the crosswind component as:
- R, if the wind comes from the right, or
- L, if the wind comes from the left.

Ident.: DSC-46-OIS-20-80-100-10-00014991.0001001 / 02 MAY 14

PURPOSE OF FLIGHT DATA

The flight crew uses the FLIGHT DATA area to enter the computation type, the cruise strategy, and the engine status.

Ident.: DSC-46-OIS-20-80-100-10-00014993.0001001 / 24 MAY 17

COMPUTATION TYPE LIST [PLAN]

Indicates the computation type.

The flight crew can select:
- FLIGHT PLAN, for a computation from a departure airport to a destination airport, or
- IN CRUISE, for a computation from the aircraft current position to a destination airport, or
- ALTERNATE, for a computation from a destination airport to an alternate airport.

Ident.: DSC-46-OIS-20-80-100-10-00015391.0001001 / 24 MAY 17

DIST ENTRY FIELD

Indicates the ground distance used for the flight plan computation.
The flight crew enters the ground distance based on the computation type.

IN CRUISE

For the IN CRUISE computation, the flight crew enters the ground distance from the aircraft current position to:
- The destination airport, or
- A diversion airport, or
- The alternate airport.

L2 The application takes into account the remaining cruise, the descent and the approach at the desired airport.

L1 **FLIGHT PLAN**

For the FLIGHT PLAN computation, the flight crew enters the ground distance from the departure airport to the destination airport.

L2 The application takes into account the takeoff, the climb, the cruise, the descent, and the approach at the destination airport.

L1 **ALTERNATE**

For the ALTERNATE computation, the flight crew enters the ground distance from the destination airport to the alternate airport.

L2 The application takes into account the go-around at destination, the climb, the cruise, the descent, and the approach at the alternate airport.

Ident.: DSC-46-OIS-20-80-100-10-00014996.0001001 / 24 MAY 17

OPT PROFILE LIST

Indicates the cruise profile that the application takes into account for performance computation.

When pressed, enables the flight crew to select:
- Yes, for a cruise with step climbs to optimum altitudes, or
- No, for a cruise at a constant level.

Ident.: DSC-46-OIS-20-80-100-10-00015384.0001001 / 24 MAY 17

RESULTS AREA [PLAN]

The RESULTS area displays a graph with the flight profile.

The graph displays key points depending on the COMPUTATION TYPE (TOC, TOD, etc.). At each key point is indicated:
- The distance covered
- The elapsed time
- The fuel burnt
- The altitude.

The total fuel burnt, the total elapsed time, the total air distance, and the FMS PERF factor are also indicated.

L2 The IN-FLT PERF application takes into account the FMS PERF factor for accurate performance computation. The flight crew can crosscheck the FMS PERF factor on the DATA/STATUS page of the MFD.
For more information about the FMS PERF factor, *Refer to DSC-22-FMS-10-50-70 PERF Factor and IDLE Factor*.

Ident.: DSC-46-OIS-20-80-100-10-00015385.0001001 / 02 MAY 14

PURPOSE OF SPECIFIC DATA

The flight crew uses the SPECIFIC DATA area to enter the computation type and the altitude data.

Ident.: DSC-46-OIS-20-80-100-10-00015386.0001001 / 24 MAY 17

COMPUTATION TYPE LIST [ATMO]

Indicates the computation type.

The flight crew can select:
- SPEED, to obtain speed conversions, the true altitude, and atmosphere information, or
- ALT, to obtain altitude corrections.

Ident.: DSC-46-OIS-20-80-100-10-00015387.0001001 / 24 MAY 17

SPD TYPE LIST AND ASSOCIATED PARAMETER [ATMO]

Indicates the type of speed.

The flight crew selects the speed type from the SPD TYPE list:
- MACH, associated with a Mach value, or
- IAS, associated with a speed value, or
- CI, associated with a Cost Index (CI), or

  L2 For more information about the CI,*Refer to PER-IFT-20-20-10 Economic Mach Number (ECON Mach)*.
- L1 Long Range Cruise (LRC) speed.

  L2 For more information about LRC,*Refer to PER-IFT-20-20-10 Long Range Cruise Speed (LRC)*.

Ident.: DSC-46-OIS-20-80-100-10-00023906.0001001 / 24 MAY 17

ALT TYPE LIST AND ASSOCIATED PARAMETERS

Indicates the type of altitude correction.

The flight crew can select:
- TRUE ALT in order to determine the true altitude of the aircraft during cruise, or
- LO ALT TEMP CORR in order to determine the altitude correction for an approach due to low temperatures.

TRUE ALT

When the flight crew selects TRUE ALT from the ALT TYPE list, the following entry fields appear below the ALT TYPE list:
- INDICATED ALT
- ARPT ELEVN.

The INDICATED ALT entry field enables the flight crew to enter the altitude as indicated by the altimeter.
The ARPT ELEVN entry field enables the flight crew to enter the terrain elevation.

LO ALT TEMP CORR

When the flight crew selects LO ALT TEMP CORR from the ALT TYPE list, the following entry fields automatically appear below the ALT TYPE list:

- HGT AAL
- ARPT ELEVN
- ARPT TEMP.

The HGT AAL entry field enables the flight crew to enter the height above the airport level.
The ARPT ELEVN and ARPT TEMP entry fields enable the flight crew to respectively enter the elevation and the temperature of the airport where the approach is conducted.

Ident.: DSC-46-OIS-20-80-100-10-00014997.0001001 / 02 MAY 14

INDICATED ALT ENTRY FIELD

Indicates the altitude displayed on the flight instruments.

Ident.: DSC-46-OIS-20-80-100-10-00015389.0001001 / 24 MAY 17

ARPT ELEVN ENTRY FIELD

The flight crew must enter the terrain elevation.

Ident.: DSC-46-OIS-20-80-100-10-00015390.0001001 / 24 MAY 17

RESULTS AREA [ATMO]

The RESULTS area displays the performance computation outputs in accordance with the COMPUTATION TYPE.

ALT COMPUTATION TYPE

If the flight crew selected TRUE ALT from the ALT TYPE list, the RESULTS area displays the following atmospheric data at the altitude entered in the INDICATED ALT entry field:

- True altitude
- Pressure
- Density ratio
- Speed of sound
- SAT.

If the flight crew selected LO ALT TEMP CORR from the ALT TYPE list, the RESULTS area displays the corrected height above the airport level.

SPEED COMPUTATION TYPE

The RESULTS area displays the performance computation outputs in two tables.

CONVERSIONS Table

Displays the following parameters:
- IAS
- Mach
- TAS
- GS
- True altitude.

ISA INFORMATION Table

Displays the following atmospheric data at the altitude entered in the INDICATED ALT entry field:
- Pressure
- Density ratio
- Speed of sound
- SAT
- TAT.

The FMS PERF factor is also indicated.
L2 The IN-FLT PERF application takes into account the FMS PERF factor for accurate performance computation. The flight crew can crosscheck the FMS PERF factor on the DATA/STATUS page of the MFD.
For more information about the FMS PERF factor, *Refer to DSC-22-FMS-10-50-70 PERF Factor and IDLE Factor*.

Ident.: DSC-46-OIS-20-80-100-10-00018363.0001001 / 02 MAY 14

MORE BUTTON

When clicked, displays the RESULTS MORE Page
The RESULTS MORE Page displays additional performance data. This data can be displayed on a table, or graphically.

RESULTS TABLE

The RESULTS table provides detailed information for the next points of the flight phase (e.g. for higher altitudes in climb, for lower weights in cruise, etc).

RESULTS GRAPH

The RESULTS graph enables the flight crew to display the evolution of one data plotted against another. The flight crew can use the crosshair to read specific values on the graph.

Note: The crosshair appears when the cursor is on the graph.

WITH TAKEOFF TICK-BOX

For climb computation only, the flight crew can validate the With Takeoff tick-box.
If the flight crew validates the With Takeoff tick-box, time and distance values are modified to take into account the takeoff.

Ident.: DSC-46-OIS-20-80-100-10-00020813.0001001 / 02 MAY 14

PURPOSE OF AIRCRAFT STATUS

The ACFT STS area enables the selection and display of CDL and NON STD CONF items, that have an impact on performance.
The current aircraft status must be considered during flight preparation.

Ident.: DSC-46-OIS-20-80-100-10-00020812.0001001 / 02 MAY 14

AIRCRAFT STATUS PANEL

The Aircraft Status Panel displays the CDL and the NON STD CONF items. The status is retrieved from the aircraft avionics, and the flight crew can manually insert additional items.
L2 The flight crew can keep the cursor over the aircraft status panel in order to increase the size of the window.
L1 If the aircraft status is not affected, "-normal-" appears.

Ident.: DSC-46-OIS-20-80-100-10-00015009.0001001 / 03 JUL 20

1 CDL ITEMS

Indicates the number of CDL items and negligible items that the application takes into account for performance computation.
When pressed, it enables the flight crew to manually select CDL items (missing items or missing meters) and enter the number of negligible items.

Note: CDL items that the flight crew selected via the OPS LIBRARY application are not transferred to the IN-FLT PERF application.

The increase of fuel consumption associated to a CDL item is automatically taken into account, provided that the CDL item is properly selected.
L2 If a CDL item with a fuel consumption increase cannot be selected but is provided in the AFM, the fuel consumption increase provided in the AFM must be entered in the FUEL PENALTY FACTOR field of the NON STD CONF items (*Refer to DSC-46-OIS-20-80-100 NON STD CONF Items Panel*).
Negligible items are missing structural parts that have a negligible impact on performance when not combined with others. The application takes into account the number of negligible items in order to apply the appropriate performance penalty.

Ident.: DSC-46-OIS-20-80-100-10-00015011.0001001 / 24 MAY 17

NON STD CONF ITEMS

Indicates the number of non standard configuration items that the application takes into account for performance computation.

When pressed, enables the flight crew to:
- Select non standard configuration items
- Enter a fuel penalty factor.

Note: The non standard configuration items are not retrieved from the aircraft avionics.

FUEL PENALTY FACTOR

The fuel penalty factor is defined as a percentage of increase of the fuel flow. The flight crew should consider the use of the fuel factor if one or more system failures affect fuel consumption.

L2 For more information about the system failures that affect fuel consumption, and the associated fuel penalty factor, *Refer to PER-IFT-FP Fuel Penalty Tables - Fuel Consumption Increased*.

L1 The flight crew should enter the same fuel penalty factor in the IN-FLT PERF application and in the FMS.

L2 For more information about the fuel penalty factor in the FMS, *Refer to DSC-22-FMS-10-50-70 FUEL PENALTY Factor*.

Ident.: DSC-46-OIS-20-80-100-10-00018573.0001001 / 02 MAY 14

OK BUTTON

When clicked, validates and displays the selected MEL, CDL, NON STD CONF items and ECAM alert in the Aircraft Status Panel.

Intentionally left blank

All fields must be completed to compute your landing performance data

Ident.: DSC-46-OIS-20-80-110-10-00013929.0001001 / 24 MAY 17

PURPOSE

The LDG PERF application provides optimized landing performance calculations for an airport.

The flight crew uses the LDG PERF application in:
- DISPATCH computation type, to determine the maximum landing weight limited by the performance (MLW(perf))
- IN FLIGHT computation type, to check landing performance during flight.

Note: The system administrator can customize all parameters related to units, fleet, and airport.

Ident.: DSC-46-OIS-20-80-110-10-00013930.0001001 / 24 MAY 17

ACCESS

The flight crew can access the LDG PERF application via the LDG PERF button of:
- The application menu, or
- The FLT OPS MENU, or
- The navigation bar, if the application is already running, or
- The OIS MENU.

Ident.: DSC-46-OIS-20-80-110-10-00014007.0001001 / 24 MAY 17

COMPUTE BUTTON

When pressed, displays the performance computation results in the results area.

Ident.: DSC-46-OIS-20-80-110-10-00014008.0001001 / 24 MAY 17

CLEAR BUTTON

When pressed, resets the inputs of the LDG PERF application to the default values.

Ident.: DSC-46-OIS-20-80-110-10-00023611.0001001 / 24 MAY 17

SYNCHRO ECAM BUTTON

When pressed, updates the list of active ECAM alerts received from the FWS.
The SYNCHRO ECAM button is only available in IN FLIGHT computation type.

Ident.: DSC-46-OIS-20-80-110-10-00013948.0001001 / 24 MAY 17

AIRPORT LIST

The flight crew can use the airport list to compute the aircraft performance for any airport available in the list.

L2 The system administrator defines the airport list.

L1 If the flight crew selects an airport different from the FLT OPS STS page, all input data are reset to standard values or cleared, after confirmation of the airport change.

Ident.: DSC-46-OIS-20-80-110-10-00013952.0001001 / 24 MAY 17

RUNWAY LIST

The flight crew can select one or multiple runway(s) of the selected airport.

When selected, the runway picture is updated.

Only one runway can be selected.

Multiple runways can be selected.

Ident.: DSC-46-OIS-20-80-110-10-00014001.0001001 / 24 MAY 17

RUNWAY CHARACTERISTICS AREA

Runway characteristics are:
- Elevation (ELEVN)
- Slope
- Length
- Altitude for go-around gradient calculation (GA GRADIENT AT).

The runway information is also displayed when the flight crew presses the runway picture (*Refer to Runway Picture*).

Ident.: DSC-46-OIS-20-80-110-10-00023612.0001001 / 24 MAY 17

MODIFY RWY BUTTON

The flight crew can press the Modify RWY button in order to modify runway characteristics.

Ident.: DSC-46-OIS-20-80-110-10-00023613.0001001 / 24 MAY 17

DONE BUTTON

When pressed, validates the entries.

Ident.: DSC-46-OIS-20-80-110-10-00023614.0001001 / 24 MAY 17

CLOSE BUTTON

When pressed, cancels the entries and returns to the LDG PERF application.

Ident.: DSC-46-OIS-20-80-110-10-00013932.0001001 / 24 MAY 17

PURPOSE OF CONDITIONS

The flight crew uses the conditions area to:
- Select an airport and one or several runways for landing performance calculation
  L2 The default airport is the destination airport from the FLT OPS STS page.
- L1 Enter the weather and runway conditions
- Select the aircraft configuration and approach type for the computation of the landing performance.

Ident.: DSC-46-OIS-20-80-110-10-00013940.0001001 / 24 MAY 17

COMPUTATION TYPE

The flight crew uses the LDG PERF application in:
- DISPATCH computation type, to determine the maximum landing weight limited by the performance (MLW(perf))
- IN FLIGHT computation type, to check landing performance during flight.

DISPATCH

To calculate the MLW(perf), the flight crew enters the forecasted conditions at destination. The aircraft status can include MEL and CDL items.

IN FLIGHT

To calculate the landing data, the flight crew enters the forecasted conditions and aircraft weight. The aircraft status can include MEL items, CDL items, and ECAM alerts.

Overweight Landing

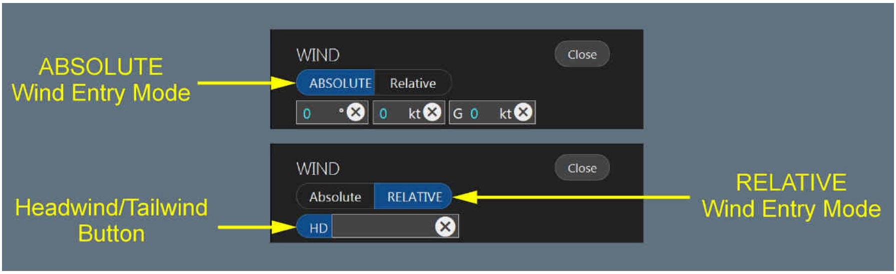
The overweight landing calculation is only available in IN FLIGHT computation type.

Ident.: DSC-46-OIS-20-80-110-10-00013934.0001001 / 24 MAY 17

WIND ENTRY FIELD

Indicates the wind for performance computation.

The flight crew can select:
- ABSOLUTE, in order to define the wind with a direction/speed/gust combination, or
- RELATIVE, in order to define the wind with a longitudinal speed component only (headwind or tailwind).

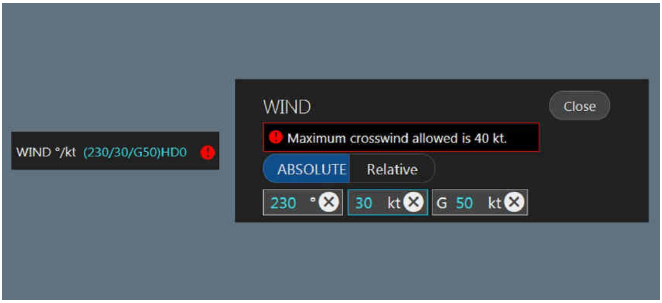


The application displays a wind sock on the side of the runway picture (*Refer to Runway Picture*). The application crosschecks the crosswind and tailwind components with the limitations of the aircraft, and in accordance with the selected runway condition.

L2 *Note:* *The computation of the crosswind component takes into account the gust value (used to check the maximum crosswind limitation). The computation of the longitudinal wind component takes into account the steady wind speed only.*

L1 Depending on the system administrator setting, if the entered wind exceeds the crosswind limitation, the following occurs:

- The flight crew cannot run the computation, or
- The flight crew can run the computation, after confirmation by a pop-up message.



WIND °/kt (230/30/G50)HD0

WIND

Maximum crosswind allowed is 40 kt.

ABSOLUTE Relative

230 ° | 30 kt | G 50 kt

L2 For more information about the crosswind limitation, *Refer to LIM-AG-OPS Maximum Crosswind for Takeoff and Landing*, and *Refer to LIM-AG-OPS Maximum Tailwind for Landing*.

Ident.: DSC-46-OIS-20-80-110-10-00013935.0001001 / 24 MAY 17

OAT ENTRY FIELD

Indicates the Outside Air Temperature (OAT) at the airport.
The flight crew manually enters the temperature.
If the flight crew entered the QNH via the QNH entry field, the temperature deviation from the International Standard Atmosphere (ISA) is automatically computed and displayed.

Note: *In DISPATCH computation type, the OAT range depends on the selected runway condition.*

Ident.: DSC-46-OIS-20-80-110-10-00013936.0001001 / 24 MAY 17

QNH ENTRY FIELD

Indicates the sea level atmospheric pressure.
The flight crew enters the QNH. The application automatically detects the unit (hPa or inHg).

Ident.: DSC-46-OIS-20-80-110-10-00013937.0001001 / 24 MAY 17

RWY COND LIST

Indicates the runway condition.

In DISPATCH computation type, the flight crew selects the runway surface condition.
In IN FLIGHT computation type, the flight crew selects the landing performance level.
L2 For more information about the runway condition/braking action, *Refer to PER-LDG-30 Runway Condition Assessment Matrix for Landing*.

Ident.: DSC-46-OIS-20-80-110-10-00013938.0001001 / 24 MAY 17

A-ICE LIST

Indicates the anti-ice setting for landing.

The flight crew can select one of the following settings from the A-ICE list:
- Off
- Engine only
- Engine & Wing
- Ice Accretion (IN FLIGHT computation type only).

Note: *The Ice Accretion selection includes the performance degradation due to the Engine & Wing anti-ice selection.*

Ident.: DSC-46-OIS-20-80-110-10-00013939.0001001 / 24 MAY 17

LW ENTRY FIELD

Indicates the estimated landing weight (LW).

The flight crew can manually:
- Enter the estimated LW, or
- Use the shortcut “*” to get the Maximum Landing Weight (MLW).

With the IN FLIGHT computation type only, the flight crew can enter an estimated landing weight that exceeds the MLW. In this case, a pop-up window asks the flight crew to confirm that they plan to attempt an overweight landing.

With the DISPATCH computation type, the estimated LW must not exceed:
- The MLW
- The performance-limited MLW (MLW(perf)).

L2 For more information about the MLW, *Refer to LIM-AG-WGHT Weight Limitations*.

Ident.: DSC-46-OIS-20-80-110-10-00014789.0001001 / 24 MAY 17

LDG CG ENTRY FIELD

Indicates the estimated Center of Gravity (CG) of the aircraft at landing.
When the flight crew uses the LOADSHEET application to determine the weight and balance data, the LDG PERF application automatically receives the landing CG. In this case, the landing CG is displayed in yellow.

The flight crew can also manually enter the landing CG.

Ident.: DSC-46-OIS-20-80-110-10-00013949.0001001 / 02 MAY 14

LDG CONF LIST

The flight crew selects the aircraft configuration for landing.

When the flight crew selects AUTO CONF, the application computes the landing performance for:
- Landing in CONF FULL (go-around in CONF 3)
- Landing in CONF 3 (go-around in CONF 2).

If both a go-around in CONF 3 and a go-around in CONF 2 comply with the go-around gradient constraint, the application displays the results for a landing in CONF FULL.
If a go-around in CONF 3 does not comply with the go-around gradient constraint, the application displays the results for a landing in CONF 3.

Ident.: DSC-46-OIS-20-80-110-10-00013950.0001001 / 24 MAY 17

AIR COND LIST

Indicates the air conditioning setting.

Ident.: DSC-46-OIS-20-80-110-10-00013951.0001001 / 24 MAY 17

APPR TYPE LIST

The flight crew selects one of the following approach types:
- Normal for a CAT I approach
- CAT II for a CAT II or CAT III approach.

When the flight crew selects CAT II, a pop-up window informs the flight crew that autoland is automatically selected in the LDG TECHNIQUE list.

Ident.: DSC-46-OIS-20-80-110-10-00013953.0001001 / 24 MAY 17

GA GRADIENT ENTRY FIELD

The flight crew enters:
- The shortcut "MIN" to get the minimum regulatory go-around gradient value, or
- The value of the required go-around gradient.

Ident.: DSC-46-OIS-20-80-110-10-00013954.0001001 / 24 MAY 17

VPILOT ENTRY FIELD

The flight crew can enter a speed increment in order to increase the approach speed.

Ident.: DSC-46-OIS-20-80-110-10-00013955.0001001 / 24 MAY 17

LDG TECHNIQUE LIST

The flight crew selects one of the following settings from the LDG TECHNIQUE list:
- MAN-A/THR off
- MAN-A/THR on
- Autoland.

When autoland is selected, the flight crew can modify the glide slope angle.

Ident.: DSC-46-OIS-20-80-110-10-00013956.0001001 / 24 MAY 17

BRK MODE LIST

Indicates the braking mode.
The braking mode input is only available in IN FLIGHT computation type.

Note: *BTV can achieve the same braking performance as manual braking. When BTV is used, the flight crew selects Manual, in order to compute the maximum braking performance.*

Ident.: DSC-46-OIS-20-80-110-10-00020884.0001001 / 24 MAY 17

REV LIST

The flight crew indicates the use of thrust reversers during landing with the selection of one of the following settings from the REV list:
- Yes
- No.

The thrust reversers input is only available in IN FLIGHT computation type.

Ident.: DSC-46-OIS-20-80-110-10-00014790.0001001 / 24 MAY 17

PURPOSE OF AIRCRAFT STATUS

The aircraft status displays the number of MEL items, CDL items, and active ECAM alerts (IN FLIGHT computation type only) that affect the landing performance.
The LDG PERF application receives the list of MEL and CDL items that the flight crew selected in the OPS LIBRARY application, and automatically receives active ECAM alerts from the FWS.
The flight crew can also manually add or remove MEL and CDL items, or ECAM alerts.

Ident.: DSC-46-OIS-20-80-110-10-00014794.0001001 / 24 MAY 17

MEL ITEMS

Indicates the number of active MEL items that the application takes into account for performance computation.
The OPS LIBRARY application sends the list of selected MEL items to the LDG PERF application.

When pressed:
- Displays the list of active MEL items that the application takes into account for performance computation
- Enables the flight crew to manually select MEL items that affect the landing performance.

Ident.: DSC-46-OIS-20-80-110-10-00014795.0001001 / 03 JUL 20

1 CDL ITEMS

Indicates the number of active CDL items and negligible items that the application takes into account for performance computation.
The OPS LIBRARY application sends the list of selected CDL items to the LDG PERF application.

When pressed:
- Displays the list of active CDL items and negligible items that the application takes into account for performance computation
- Enables the flight crew to manually select CDL items (missing items or missing meters) and enter the number of negligible items.

L2 Negligible items are missing structural parts that have a negligible impact on performance, when not combined with others. The application takes into account the number of negligible items in order to apply the appropriate performance penalty.

Ident.: DSC-46-OIS-20-80-110-10-00014796.0001001 / 24 MAY 17

ECAM ALERTS

Indicates the number of active ECAM alerts that the application takes into account for performance computation.
The LDG PERF application automatically receives the list of active ECAM alerts from the FWS.

When pressed:
- Displays the list of active ECAM alerts that the application takes into account for performance computation
- Enables the flight crew to manually select ECAM alerts that affect the landing performance.

Note: *The ECAM alerts are available in IN FLIGHT mode only.*

Ident.: DSC-46-OIS-20-80-110-10-00014798.0001001 / 24 MAY 17

PURPOSE OF RESULTS

The results area displays the performance computation outputs.
The system administrator can customize the list of outputs.

Two functions are available:
- In case of single runway computation, one result is available
- In case of multiple runway computation, one result per selected runway is available.

Ident.: DSC-46-OIS-20-80-110-10-00020839.0001001 / 24 MAY 17

SELECTED RUNWAY

The displayed performance results are applicable to the selected runway, recalled above the results area.

Ident.: DSC-46-OIS-20-80-110-10-00023617.0001001 / 24 MAY 17

RUNWAY PICTURE

The runway picture corresponds to the selected runway, with the associated Landing Distance Available (LDA) on the runway centerline.

L2 The dark grey area corresponds to the LDA that includes user modifications.
The unusable parts of the runway are displayed in light grey.
If applicable, the displaced threshold is displayed.

L1 After computation of the landing performance, the following results are displayed on the runway picture:
- The Landing Distance (LD), *Refer to LD*
- The Factored Landing Distance (F-LD), *Refer to F-LD*
- The Stop Margin, *Refer to Stop Margin*.

Ident.: DSC-46-OIS-20-80-110-10-00023618.0001001 / 24 MAY 17

WIND SOCK

The wind sock indicates the wind direction relative to the runway.

L2 If the flight crew entered the wind as a direction and speed combination, both the crosswind and longitudinal wind components are displayed. If the flight crew only entered the longitudinal wind component, the crosswind component cannot be computed.

Ident.: DSC-46-OIS-20-80-110-10-00021231.0001001 / 24 MAY 17

MESSAGE

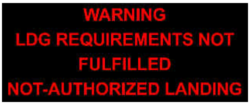
FACTORED LD ABOVE RWY LENGTH

Indicates that the LD is less than the LDA, and the F-LD is more than the LDA.

L12

EXPECTED ROW ALERT

Indicates that the ROW LDG DIST is more than the LDA.
For more information about the ROW landing distance crosscheck at dispatch, *Refer to PER-LDG-40 ROW Landing Distance Crosscheck*.
For more information about the ROW landing distance crosscheck in flight, *Refer to PER-LDG-50 ROW Landing Distance Crosscheck*.



WARNING
LDG REQUIREMENTS NOT FULFILLED
NOT-AUTHORIZED LANDING

Indicates that at least one of the certified landing requirements is not satisfied.

Ident.: DSC-46-OIS-20-80-110-10-00014802.0001001 / 24 MAY 17

MLW(PERF)

The maximum performance-limited landing weight (MLW(perf)) is the maximum weight that complies with all regulatory requirements at landing.

CAUTION	The MLW(perf) may be above the MLW, but the aircraft must not be dispatched with an estimated landing weight at destination above the MLW.

Ident.: DSC-46-OIS-20-80-110-10-00014803.0001001 / 24 MAY 17

FLAPS

Appears when an active ECAM alert affects the landing performance and enables the selection of the landing configuration.

L2 In this case, the LDG CONF list is no longer available in the conditions area (*Refer to LDG CONF List*).

L1 If the active ECAM alert requires a specific flaps configuration, the selection of the landing configuration is no longer possible and the required flaps lever position is displayed.

Ident.: DSC-46-OIS-20-80-110-10-00014804.0001001 / 02 MAY 14

LIMITATION CODE

Several regulatory requirements can limit the landing performance. The limitation codes identify the requirements that limit the landing performance.
The following table indicates the various codes used for the landing limitations.

Code	Description
WGT	Weight limited by the LW
LDA	Weight limited by the landing distance
ACG	Weight limited by the approach climb gradient

Continued on the following page

Continued from the previous page

Code	Description
LCG	Weight limited by landing climb gradient
TIRE	Weight limited by tire speed
BRK	Weight limited by brake energy

Ident.: DSC-46-OIS-20-80-110-10-00014805.0001001 / 24 MAY 17

DISPATCH LD

The Dispatch LD indicates the landing distance that the flight crew should consider for dispatch.
The Dispatch LD is the maximum between the F-LD and the Required Landing Distance (RLD).
The RLD is the actual landing distance multiplied by the regulatory factor. The regulatory factor depends on the runway condition.

Note: *The RLD is available in DISPATCH computation type only.*

Ident.: DSC-46-OIS-20-80-110-10-00014837.0001001 / 24 MAY 17

LD

The LD corresponds to the landing distance calculated according to the forecasted conditions.

Ident.: DSC-46-OIS-20-80-110-10-00014808.0001001 / 24 MAY 17

FACTOR/INCREMENT

The FACTOR/INCREMENT is the coefficient used to compute the F-LD.

Note: *The FACTOR/INCREMENT is only displayed if the F-LD exceeds the LDA.*

Ident.: DSC-46-OIS-20-80-110-10-00014809.0001001 / 24 MAY 17

F-LD

The Factored LD (F-LD) is the reference for in-flight landing distance assessment.
The F-LD is the LD multiplied by the FACTOR/INCREMENT.

Ident.: DSC-46-OIS-20-80-110-10-00014807.0001001 / 24 MAY 17

EO GA GRADIENT

The EO GA GRADIENT is the Engine-Out Go-Around (EO GA) climb gradient.
The EO GA GRADIENT must be more than or equal to the minimum climb gradient entered in the GA GRADIENT entry field of the conditions area (*Refer to GA GRADIENT Entry Field*).

Ident.: DSC-46-OIS-20-80-110-10-00023649.0001001 / 24 MAY 17

EO GA SPEED

Indicates the Engine-Out Go-Around (EO GA) speed.

Ident.: DSC-46-OIS-20-80-110-10-00023650.0001001 / 24 MAY 17

LDG CONF

Displays the landing configuration used for the landing performance calculation: CONF 3 or CONF FULL.

If the flight crew selected AUTOCONF from the LDG CONF list:
- The application performs performance calculation for both flaps settings
- If landing is possible in both configurations, only the CONF FULL results are displayed.

Ident.: DSC-46-OIS-20-80-110-10-00014810.0001001 / 24 MAY 17

STOP MARGIN

The stop margin is the difference between the LDA and the computed landing distance.

Ident.: DSC-46-OIS-20-80-110-10-00014811.0001001 / 24 MAY 17

VAPP

VAPP is the aircraft approach speed considered for the landing performance computation, 50 ft above the runway surface.

L2 For more information about VAPP, *Refer to DSC-22-27-10-20 VAPP*.

L1 WITHOUT ANY ACTIVE ECAM ALERT

VAPP is the sum of VLS, APPR COR, and ΔV Pilot.
APPR COR is the highest value of ΔV Wind, ΔV A/THR, and ΔV Ice Accretion.

WITH AN ACTIVE ECAM ALERT

VAPP is the sum of VREF, ΔVREF, APPR COR, and ΔV Pilot.
APPR COR is the highest value of ΔV Wind, ΔV A/THR, and ΔV Ice Accretion.

Ident.: DSC-46-OIS-20-80-110-10-00023721.0001001 / 24 MAY 17

DETAILED RESULTS

Displays the list of detailed results.

Note: *The system administrator defines the list.*

R WING 20000

Ident.: DSC-46-OIS-20-80-120-10-00018335.0001001 / 02 MAY 14

PURPOSE

The flight crew uses the LOADSHEET application to compute aircraft weights and corresponding CG positions before dispatch.

Ident.: DSC-46-OIS-20-80-120-10-00018336.0001001 / 24 MAY 17

ACCESS

The flight crew can access the LOADSHEET via the LOADSHEET button of:
- The application menu, or
- The FLT OPS MENU, or
- The navigation area, if the application is already running, or
- The OIS MENU.

Ident.: DSC-46-OIS-20-80-120-10-00018325.0001001 / 24 MAY 17

CONFIGURATION/LOADING AREA

The flight crew uses this area in order to define the loading configuration, the payload, and fuel data.

Ident.: DSC-46-OIS-20-80-120-10-00018327.0001001 / 24 MAY 17

AIRCRAFT STATUS

Indicates the number of active MEL items that affect the loading capabilities of the aircraft.
The LOADSHEET application receives the list of MEL items that the flight crew ticked in the OPS LIBRARY application. The flight crew can also press the MEL items button to manually select MEL items.

Ident.: DSC-46-OIS-20-80-120-10-00018328.0001001 / 24 MAY 17

DETAILS - FOB WITH LMC TOTAL TAB

Displays information about the payload and the distribution of fuel in the fuel tanks.

Ident.: DSC-46-OIS-20-80-120-10-00018329.0001001 / 24 MAY 17

RESULTS AREA

The RESULTS area displays the loadsheet with the associated weight and CG values.
The LOADSHEET application can transmit some results to other applications (e.g transmit the LW and LDG CG to the LDG PERF application).

Ident.: DSC-46-OIS-20-80-120-10-00018330.0001001 / 24 MAY 17

COMPUTE BUTTON

When pressed, displays the loading computation results in the RESULTS area.

Ident.: DSC-46-OIS-20-80-120-10-00018331.0001001 / 24 MAY 17

EXPORT BUTTON

The flight crew can press the Export button in order to generate a loadsheet report.
The flight crew can either print the report, or transfer the report to the EXPORT BOX.

Ident.: DSC-46-OIS-20-80-120-10-00023537.0001001 / 24 MAY 17

MODIFY BUTTON

When pressed, enables the modification of the settings of the configuration/loading area.

Ident.: DSC-46-OIS-20-80-120-10-00018332.0001001 / 24 MAY 17

CLEAR BUTTON

When pressed, clears the data, or resets the default value of the data.

Intentionally left blank

GATELINK INOP
SATCOM INOP

Ident.: DSC-46-OIS-20-80-140-10-00023672.0001001 / 24 MAY 17

PURPOSE

The flight crew uses the EXPORT BOX to transfer the following elements to external storage devices (e.g. USB stick):

- Takeoff performance results
- Landing performance results
- Loadsheet
- EFF.

Ident.: DSC-46-OIS-20-80-140-10-00023673.0001001 / 24 MAY 17

ACCESS

The flight crew can access the EXPORT BOX via the EXPORT BOX button of:

- The application menu, or
- The FLT OPS MENU, or
- The navigation bar, if the application is already running, or
- The OIS MENU.

Ident.: DSC-46-OIS-20-80-140-10-00016922.0001001 / 24 MAY 17

USB STICK STATUS

When a USB stick is plugged, indicates the storage capacity of the USB stick.
The grey part indicates the data already stored.
The blue part indicates the additional data, selected via the USB column.

Ident.: DSC-46-OIS-20-80-140-10-00016921.0001001 / 24 MAY 17

WIRELESS STATUS

GATELINK AVAIL	The GATELINK is available.
GATELINK NOT AVAIL	The GATELINK is not available.
GATELINK INOP	The GATELINK is inoperative because of system customization.
SATCOM AVAIL	The SATCOM is available.
SATCOM NOT AVAIL	The SATCOM is not available.

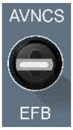
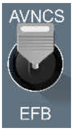
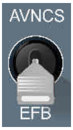
OIS SW



The OIS sw is in the neutral position.
When pushed up, displays the application that the flight crew opened last on the AVNCS side.
When pushed down, displays the application that the flight crew opened last on the EFB side.



Displays the application that the flight crew opened last on the AVNCS side.
When released, the OIS sw is on the neutral position.

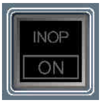


Displays the applications that the flight crew opened last on the EFB side.
When released, the OIS sw is on the neutral position.

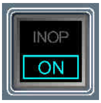
L2 The flight crew can also use the EFB key, or the AVNCS key of the OIS keyboard.*Refer to DSC-46-OIS-20-100 AVNCS Key*

Ident.: DSC-46-OIS-20-90-10-00015810.0001001 / 02 MAY 14

CAPT(F/O) OIS ON CENTER PB

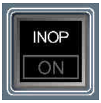


The CAPT(F/O) OIS is displayed on the CAPT(F/O) outer DU.



The CAPT(F/O) OIS is displayed on the center lower DU.

L12



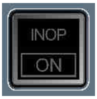
The CAPT(F/O) OIS cannot be displayed on the center lower DU.

The OIS ON CENTER function is not available because:
- The ECAM is displayed on the center lower DU, or
- The center lower DU is failed, or
- The outer and inner DUs are failed on both CAPT and F/O side.

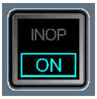
L2 For more information about display reconfiguration, *Refer to DSC-31-CDS-30-30 Normal Operations*

Ident.: DSC-46-OIS-20-90-10-00015809.0001001 / 02 MAY 14

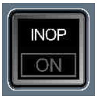
CAPT (F/O) VIEW OFFSIDE PB



The CAPT(F/O) OIS displays the CAPT(F/O) OIS on the onside DU.



The onside outer DU displays the offside OIS.



The OIS VIEW OFFSIDE pb is not available because:
- The other flight crewmember sets the OIS VIEW OFFSIDE to ON, or
- The other flight crewmember selects the CAPT(F/O) OIS ON CENTER to ON, or
- The function is not available due to an automatic display reconfiguration on the outer DU.

L2 For more information about display reconfiguration, *Refer to DSC-31-CDS-30-30 Normal Operations*.

L1 OIS VIEW OFFSIDE : ON

L12

OIS VIEW OFFSIDE:ON

en displayed on a DU, indicates that the VIEW FSIDE function is activated.
The OIS VIEW OFFSIDE : ON label is displayed on top of the onside OIS. The offside OIS does not display the label.

Note: *The flight crewmember cannot control the offside OIS.*

HOW TO START THE EFB DEVICE

Ident.: DSC-46-OIS-30-00016267.0001001 / 07 AUG 19
Applicable to: ALL

IF THE EFB DEVICE IS A/C ATTACHED

The EFB device is permanently connected to the aircraft, and remains in the laptop docking station.

- **If the Laptop Docking Station is OFF**

  Each flight crew member must:
  1. Start the docking station: Press the DOCK STATION pb
  2. Start the EFB device: Press the LAPTOP pb.

- **If the Laptop Docking Station is ON:**
  Each flight crew member must press the LAPTOP pb.

IF THE EFB DEVICE IS PILOT ATTACHED

Each flight crew member brings an EFB device onboard, and must perform the following actions in sequence:

1. Check that the docking station is OFF
2. Check that the EFB device is OFF
3. Plug-in the connection cables
4. Start the EFB device: Press the LAPTOP pb
5. Stow the EFB device and the cables into the Laptop Docking Station
6. Start the docking station: Press the DOCK STATION pb.

Note: *This sequence ensures that the EFB device and the docking station are correctly paired.*

HOW TO START OR SWITCH OFF THE SPARE EFB (EFB3) ◁

Ident.: DSC-46-OIS-30-00016334.0001001 / 09 MAR 16
Applicable to: ALL

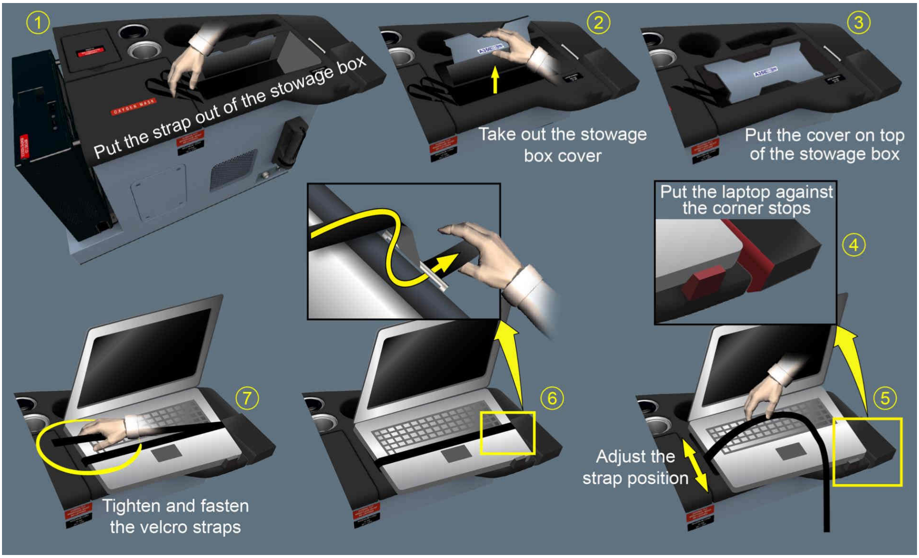
In order to start or switch off the spare EFB ◁ , the flight crew must use a software button available in the FLT OPS MENU.

L2 For more information about the FLT OPS MENU, *Refer to DSC-46-OIS-20-80-50 FLT OPS MENU Overview*.

HOW TO STRAP THE LAPTOP ON THE LATERAL CONSOLE

Ident.: DSC-46-OIS-30-00017232.0001001 / 03 DEC 15
Applicable to: ALL

How to Strap the Laptop on the Lateral Console

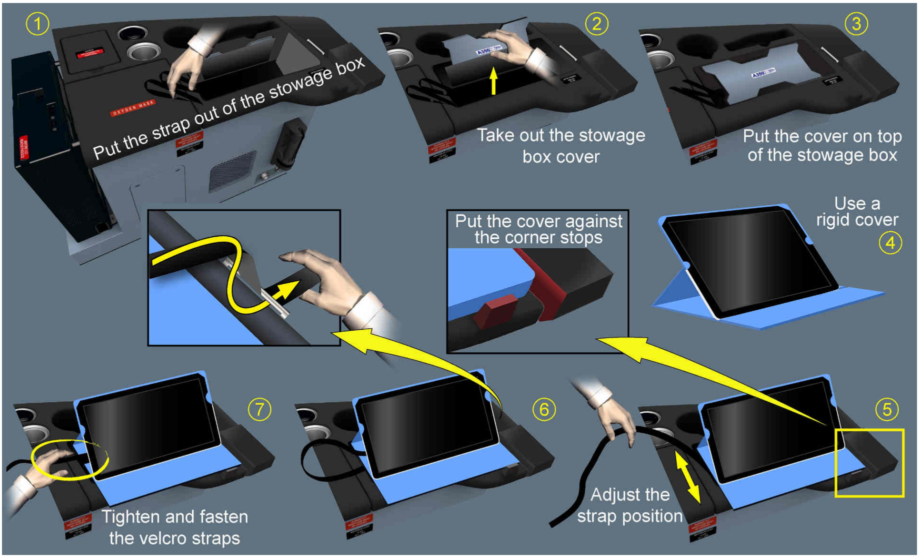


①
Put the strap out of the stowage box
②
Take out the stowage box cover
③
Put the cover on top of the stowage box
④
Put the laptop against the corner stops
⑤
Adjust the strap position
⑥
⑦
Tighten and fasten the velcro straps

HOW TO STRAP A TABLET ON THE LATERAL CONSOLE

Ident.: DSC-46-OIS-30-00023340.0001001 / 09 MAR 16
Applicable to: ALL

Note: *A tablet with a keyboard attached to the tablet must be considered as a laptop (Refer to DSC-46-OIS-30 How To Strap the Laptop on the Lateral Console).*



①
Put the strap out of the stowage box
②
Take out the stowage box cover
③
Put the cover on top of the stowage box
Use a rigid cover
④
Put the cover against the corner stops
⑤
Adjust the strap position
⑥
⑦
Tighten and fasten the velcro straps

Intentionally left blank

OIS APPLICATIONS TEMPORARY LOSS AFTER ENG 2 SHUTDOWN

1 Ident.: DSC-46-OIS-35-00025510.0001001 / 07 JUL 20
Applicable to: ALL

The OSFC hosts the Maintenance, Cabin, Communication applications and some Basic Services.
Power transient while engine 2 is shutdown may cause automatic reset of the OSFC.
This may occur during an ECAM procedure, or during one engine taxi operation with APU off.
During the OSFC reset, the following effects may occur:

- EXPECT EFB DISPLAY LOSS ON OIS DURING 3 MIN
  The OIS CAPT+F/O OIS DISPLAY FAULT ECAM alert appears. If EFB applications are required during the 3 min, unstow the EFB laptop.
- EXPECT COMPANY COM LOSS DURING 9 MIN
- EXPECT OSFC APPLICATION/FUNCTIONS LOSS DURING 9 MIN
- EXPECT CABIN CONNECTIVITY LOSS DURING 9 MIN
  Cabin connectivity includes cabin crew Wi-Fi ◁ , passenger Wi-Fi ◁ , internet ◁ .

GENERAL

Ident.: DSC-49-10-00001390.0001001 / 07 APR 20
Applicable to: ALL

The Auxiliary Power Unit (APU) can provide:

- On ground:
  - Bleed air for engine start, and for air conditioning
  - Electrical power.

  Note: *An APU ECON MODE provides reduced bleed air performance for air conditioning.*

- During takeoff: bleed air for air conditioning (e.g. when optimum aircraft performance is required).
- In flight:
  - Bleed air to assist engine start, up to an altitude of 25 000 ft
  - Bleed air as a backup for pressurization and air conditioning, up to an altitude of 25 000 ft

    Note: *Dual pack operation is possible up to an altitude of 22 500 ft*

  - A backup for electrical power within the aircraft environmental envelope.

L3 During ground operations, the APU fuel consumption is about:

- 230 kg/h (505 lb/h) with packs ON and APU GEN ON, or
- 180 kg/h (395 lb/h) with APU GEN ON.

At FL100, the APU fuel consumption is about:

- 170 kg/h (375 lb/h) with APU BLEED ON and APU GEN ON.

APU ENGINE

The APU has one rotor.

The rotor provides power for bleed air and electrical generation.

L3 The rotor is made of a turbine that drives the load compressor. The air compressed by the load compressor is delivered to the bleed air system.

The rotor is connected to a shaft that drives the Starter Generator (SG) in generator mode.

Ident.: DSC-49-10-10-00001393.0001001 / 29 APR 14

APU STARTER GENERATOR SYSTEM

The APU Starter Generator System (SGS) is a dual function system that can start the APU and supply electrical power (230 V AC).

L3 The APU Starter Generator System (SGS) has a Starter Generator (SG), a Starter Power Unit (SPU) and a Starter Generator Control Unit (SGCU).

L1 The SGS starts the APU, when the air-intake flap is fully open, and the START pb is set to ON.

L2 The APU can either start on:
- Two 28 V DC batteries.
  The SPU converts the DC supply to start the APU.
- The 230 V AC supply.
  The SGCU converts the AC supply to start the APU.

L1 When the APU is running, it drives the SGS that provides power at a constant frequency of 400 Hz.

Ident.: DSC-49-10-10-00001394.0001001 / 29 APR 14

L2 ELECTRONIC CONTROL BOX (ECB)

The ECB monitors and controls the operation of the APU, and displays the applicable information on the ECAM.

The ECB:
- Sequences and monitors the APU start
  L3 *Refer to DSC-49-30 APU Manual Start*
- L2 Monitors the operating parameters of the APU
  Such parameters include N and Exhaust Gas Temperature (EGT)
  L3 Other parameters include speed management, speed limitation, temperature limitation, independent overspeed protection, and inlet guide vane control
- L2 Monitors bleed air.
  L3 The ECB controls the APU bleed valve and the air intake flap position
- L2 Sequences the manual or automatic shutdown
  L3 For more information, *Refer to DSC-49-30 APU Shutdown*
  For more information, *Refer to DSC-49-40 APU Automatic Shutdown*
- L2 Controls the emergency shutdown.
  L3 For more information, *Refer to DSC-49-40 APU Emergency Shutdown*

Ident.: DSC-49-10-10-00001395.0001001 / 29 APR 14

AIR-INTAKE

The external air flows into the APU via an air-intake flap. The flap automatically closes, when the APU is not in operation or in the case of an emergency.

L2 The ECB automatically and electrically controls the opening and closure of the flap.

Ident.: DSC-49-10-10-00001396.0001001 / 29 APR 14

L3 INLET GUIDE VANES (IGV)

The IGVs control the bleed airflow, based on aircraft demand.
They regulate the flow of air that enters and exits the load compressor.
The ECB controls the IGVs.

Ident.: DSC-49-10-10-00001399.0001001 / 29 APR 14

APU BLEED AIR

The APU can provide bleed air to the bleed air system, via the APU bleed valve (*Refer to DSC-36-20 APU Bleed Valve Indications*).

L3 Based on aircraft demand, the position of the IGVs controls the airflow to the bleed air system.

L2 The ECB controls the APU bleed air.

Ident.: DSC-49-10-10-00001400.0001001 / 04 DEC 14

L2 OIL SYSTEM

The APU has an oil system that lubricates and cools the APU components.
The ECB monitors the oil system (i.e. oil quantity, oil pressure and oil filter).

OIL QUANTITY

The oil tank has an oil level sensor that detects a low level of oil.
If the oil quantity reaches the low level when the aircraft is on ground, and the APU is off, the APU SD page immediately displays the OIL LEVEL LO advisory. In normal conditions, the APU can continue to operate for at least 20 h.
However if the oil quantity reaches the low level when the aircraft is in flight, or when the APU is on, the OIL LEVEL LO advisory will appear only when the aircraft is on ground, and the APU is off. As a result, the remaining operating time may be less than 20 h.
If the oil quantity continues to decrease to the critical oil level, the APU automatically shuts down and the ECAM triggers the APU AUTO SHUTDOWN alert (*Refer to procedure*).

Ident.: DSC-49-10-10-00001401.0001001 / 29 APR 14

L2 FUEL SYSTEM

The fuel system supplies the APU with the appropriate quantity of fuel. (*Refer to DSC-28-10 APU Feed*).

The APU fuel feedline has two fuel shutoff valves, the APU isolation valve and the APU LP valve.
The fuel shutoff valves automatically close when the APU is not in operation, or in the case of an emergency.
The ECB controls the fuel flow.

Generator Contactor

	The APU generator supplies electrical power to the electrical network.
	The APU generator is not connected to the electrical network.

Generator Indication

	Normal operation.
	The APU generator is failed.

Generator Load

L12

	The APU generator load is normal. The load is normal, when it is less than 120 %.
L12	
	There is an overload on the APU generator. The load is above 120 % for more than 5 min or above 160 % for more than 5 s.

Generator Voltage

L12

	The APU generator voltage is normal. The voltage is normal between 230 V and 240 V.
	The APU generator voltage is abnormal.

Generator Frequency

L12

	The APU generator frequency is normal. The frequency is between 385 Hz and 418 Hz.
	The APU generator frequency is abnormal.

Ident.: DSC-49-20-30-00001930.0001001 / 29 APR 14

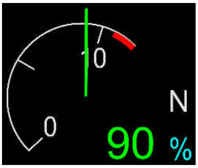
APU FU INDICATION

The quantity of fuel, used by the APU, since the last reset.

This value resets at:
- The first engine-start, and
- The last engine-shutdown.

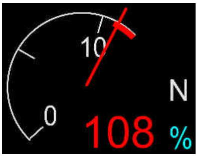
Ident.: DSC-49-20-30-00001931.0001001 / 27 MAY 14

APU N



The APU N rotation speed is normal.

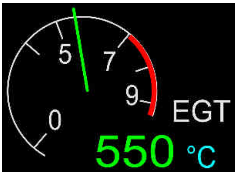
L12



APU N rotation speed is equal to, or more than, the APU N red limit.
The APU N red limit is the lower border of the red arc.
The red limit starts at 106 %.
An automatic shutdown sequence begins.
Associated with the following ECAM alert: APU AUTO SHUTDOWN (*Refer to procedure*).

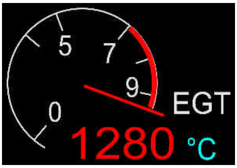
Ident.: DSC-49-20-30-00001933.0001001 / 27 MAY 14

APU EGT



The APU EGT is normal.

L123



The APU EGT is at, or more than, the APU EGT red limit. The APU EGT red limit is the lower border of the red arc. If the A/C is on ground, an automatic shutdown sequence begins.
The ECB computes the APU EGT red limit. This limit can vary from 680 °C up to 1 260 °C (during APU start), depending on several external parameters (e.g. ambient temperature, pressure).

Associated with one of the following ECAM alerts:
- APU AUTO SHUTDOWN (*Refer to procedure*)(if the A/C is on ground), or
- APU FAULT (*Refer to procedure*)(if the A/C is in flight).

Ident.: DSC-49-20-30-00001934.0001001 / 29 APR 14

OIL LEVEL LO INDICATION

L12

OIL LEVEL LO

lses, and indicates a low quantity of APU oil.
is indication only appears on ground.
When this indication appears, the APU SD page automatically appears.
For more information about oil low level detection, *Refer to DSC-49-10 Oil System*.

Ident.: DSC-49-20-30-00001935.0001001 / 29 APR 14

FLAP INDICATION

FLAP MOVING

he air-intake flap moves to the open, or to the closed position.

FLAP OPEN

The air-intake flap is fully open.

L12

FLAP CLOSED

The air-intake flap is closed.
This indication is only displayed during 10 s, when the flap is closed, then the flap indication disappears.

Ident.: DSC-49-20-30-00001936.0001001 / 29 APR 14

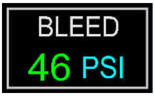
FUEL PRESS LO INDICATION

FUEL PRESS LO

PU fuel pressure is low.

Ident.: DSC-49-20-30-00001937.0001001 / 29 APR 14

APU BLEED PRESSURE



Indicates the current pressure of APU bleed air.

Ident.: DSC-49-20-30-00001938.0001001 / 29 APR 14

APU BLEED VALVE

The APU bleed valve is closed.

The APU bleed valve is open.

The APU bleed valve is abnormally closed if:
- The APU bleed valve is closed, and
- The Bleed Air System (BAS) requests APU bleed air.

Note: *(The request for APU bleed air can be automatic, or manual via the APU BLEED pb-sw).*

The APU bleed valve is abnormally open:
- If the APU bleed valve is not closed, and the BAS does not request APU bleed air, or
- If the APU bleed valve is not fully open, and the BAS requests APU bleed air.

Note: *(The request for APU bleed air can be automatic, or manual via the APU BLEED pb-sw).*

AUTOMATIC APU START AND BLEED SUPPLY

In the case of an all engine failure in flight, the APU automatically starts and supplies bleed air in order to assist engine relight.

L2 The APU automatically starts if:
- The A/C is in flight
- An all engines failure is detected
  L3 In order to wait for the RAT extension, the automatic APU start is initiated 10 s after the detection of the all engines failure.
- L2 The Mach number is more than 0.12
- Both Main L(R) TK fuel pumps are not at low pressure
- There is no APU inhibition start.

L1 When the APU automatically starts, all of the following occurs:
- The ON light of the START pb comes on
- The APU start sequence begins
- When the APU runs with the appropriate computed speed, both of the following occur:
  - On the START pb, the ON light goes off and the AVAIL light comes on
  - The APU AVAIL memo appears on the WD and on the APU SD page.

Note: *If the MASTER SW pb-sw is not pressed, it remains off.*

Following an automatic start, the APU bleed valve opens and the APU supplies bleed air to the bleed air system when:
- The APU is AVAIL
- The flight crew sets one of the engine master lever to the START position
- The aircraft altitude is below 25 000 ft.

Ident.: DSC-49-30-10-00001941.0001001 / 29 APR 14

APU SHUTDOWN

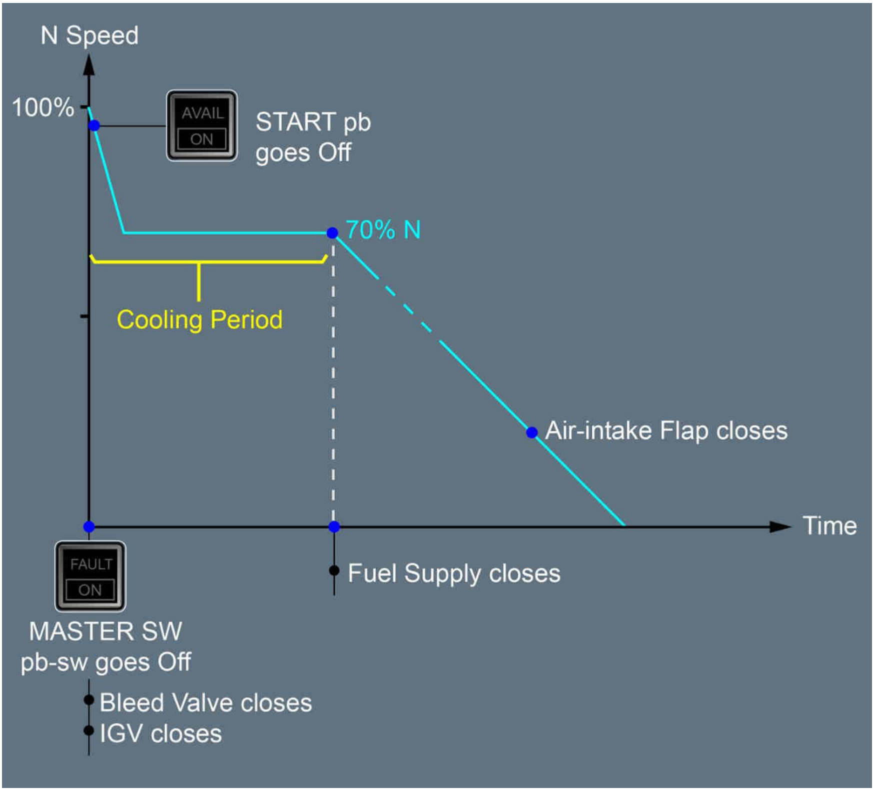
When the APU is available, and the MASTER SW pb-sw is pressed:

- The ON light of the MASTER SW pb-sw goes off
- The APU bleed valve closes (if open)
- L3 The inlet guide vanes close
- L1 The AVAIL light of the START pb goes off
- N decreases down to 70 % to cool down the APU engine, if necessary

  L3 An 85 s cooling period enables the APU to run with a minimum load, in order to reduce the temperature of the APU engine.
- L1 Fuel supply to the APU stops at the end of the shutdown period
- The air-intake flap closes
- The APU stops.

L3 DETAILED APU SHUTDOWN SEQUENCE

Detailed APU Shutdown Sequence



The complete shutdown sequence can last up to 2 min and 30 s until the flap is closed.

OVERVIEW

Ident.: DSC-52-10-00001948.0002001 / 09 MAR 16
Applicable to: ALL

The aircraft has:

- In the cabin:
  8 passenger doors.
  The crewmembers manually control the cabin doors.
- In the cockpit:
  - One cockpit door
  - One cockpit escape hatch
  - One privacy door ◁ .
- In the cargo compartments:
  Three cargo compartment doors.
- In the avionics bays:
  - One external door for access from outside the aircraft
  - Two internal doors for access from the cargo compartments
  - One hatch for access from the cockpit.

The Doors and Slides Control System (DSCS) monitors:

- The passenger doors and associated slides (*Refer to DSC-52-30-10 Passenger Doors*)
- The cargo doors (*Refer to DSC-52-60-10 Overview*)
- The external and internal access doors to the avionics bays (*Refer to DSC-52-20-10 Overview*)
- The cockpit escape hatch (*Refer to DSC-52-50-10 Cockpit Escape Hatch*).

L2 DOORS AND SLIDES CONTROL SYSTEM

L3 The Doors and Slides Control System (DSCS) has:

- Four DSCS applications hosted in CPIOMs H31, H32, H33 and H34
- Several CRDCs.

L2 The main functions of the DSCS are to:

- Monitor and display on the DOOR/OXYGEN SD page the status of:
  - The passenger doors
  - The escape slides
  - The cargo doors
  - The cockpit escape hatch
  - The external access door to the forward avionics bay.
- Monitor the status of the two internal access doors to the forward and aft avionics bays.
- Control the automatic operations of forward and aft cargo doors.
- Manage:
  - The residual cabin pressure indication
  - The inhibition of cabin and cargo pressurization if one or more passenger or cargo doors are not locked.

Ident.: DSC-52-10-GARCH-00002536.0001001 / 24 APR 14

L2 AUTONOMOUS STANDBY POWER SUPPLY UNIT

The Autonomous Standby Power Supply Unit (ASPSU) detects and indicates the residual cabin pressure.
In the case of an electrical power loss, the ASPSU provides electrical power for the residual cabin pressure indication for 45 min.

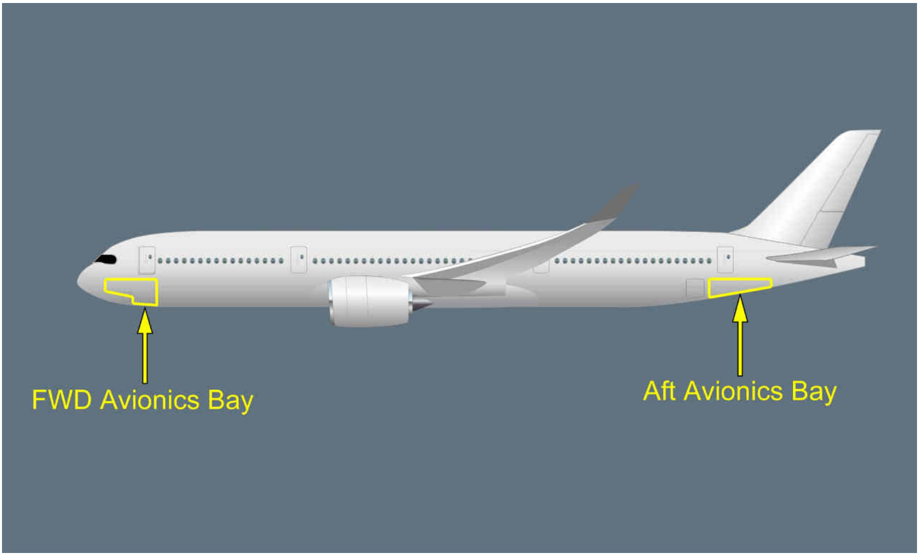
Intentionally left blank

OVERVIEW

Ident.: DSC-52-20-10-00002576.0001001 / 24 APR 14
Applicable to: ALL

The aircraft has two avionics bays:
- The FWD avionics bay
- The Aft avionics bay.

Overview



FWD AVIONICS BAY

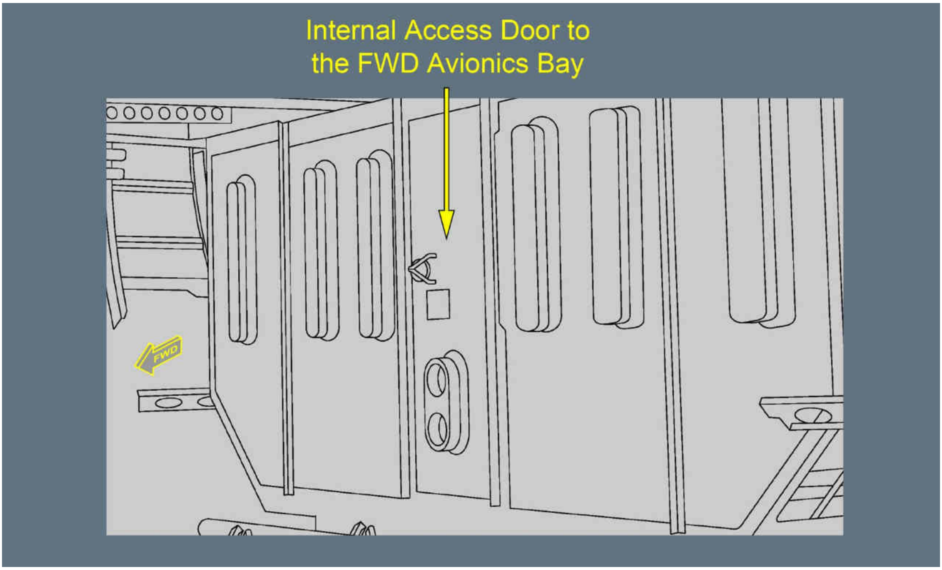
Ident.: DSC-52-20-10-00002577.0001001 / 24 APR 14

Applicable to: ALL

It is possible to access the FWD avionics bay from:

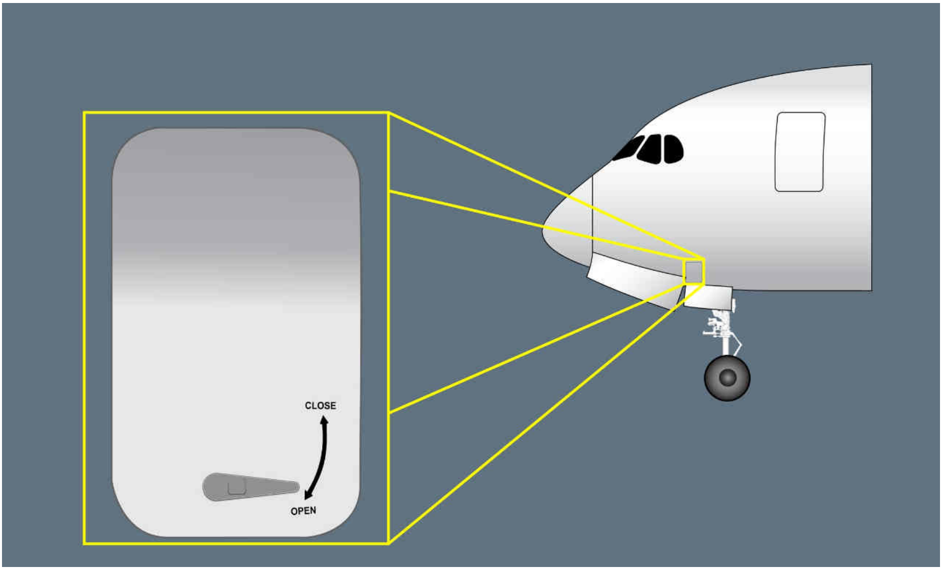
- The forward cargo compartment through one internal access door

Internal Access Door to the FWD Avionics Bay



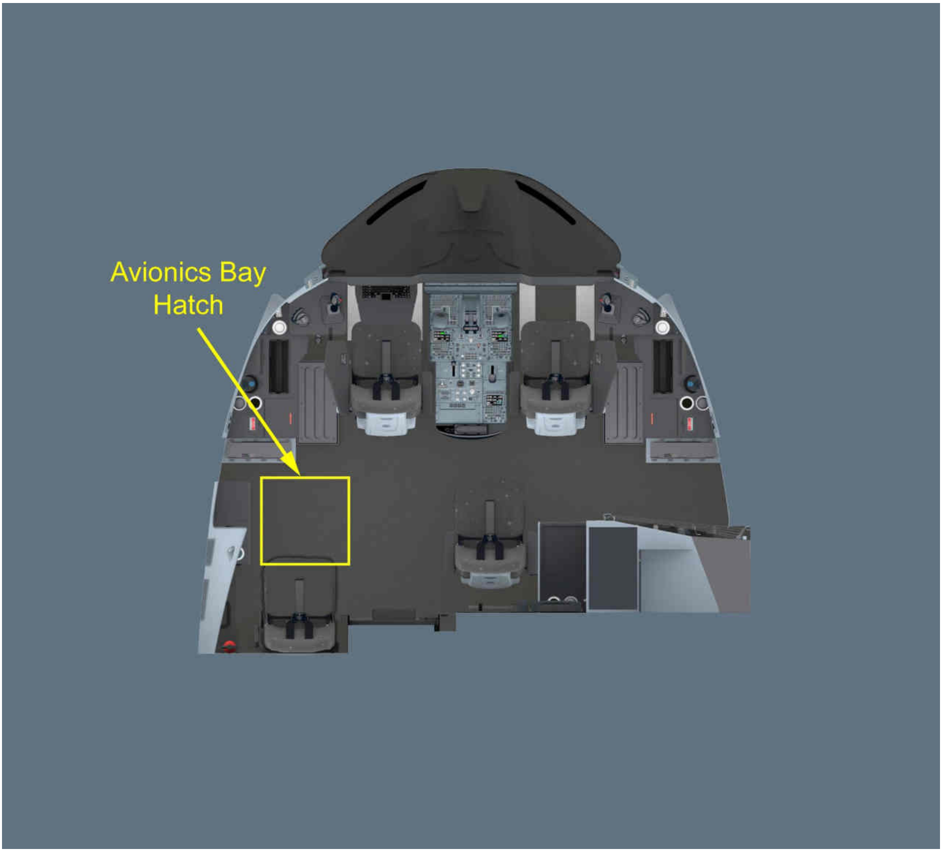
- Outside the aircraft, via an inward-opening external access door.
  This door can be manually operated from either the interior or the exterior of the aircraft.

External Access Door to the FWD Avionics Bay



- The cockpit, through a hatch on the floor.
  A ladder is available in the avionics bay for access from the cockpit.

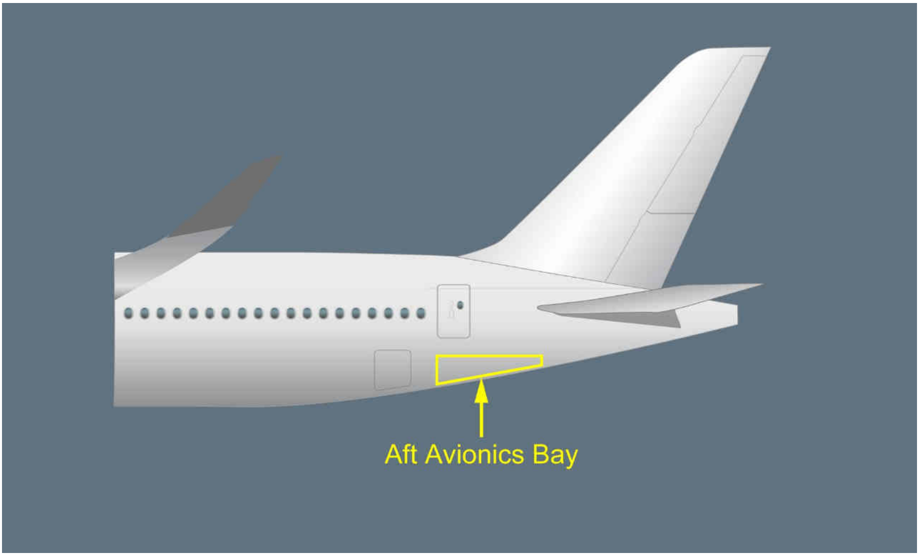
Cockpit Hatch to the FWD Avionics Bay



AFT AVIONICS BAY

Ident.: DSC-52-20-10-00002579.0001001 / 24 APR 14
Applicable to: ALL

The aft avionics bay is accessible from the bulk cargo compartment through one internal access door.



Aft Avionics Bay

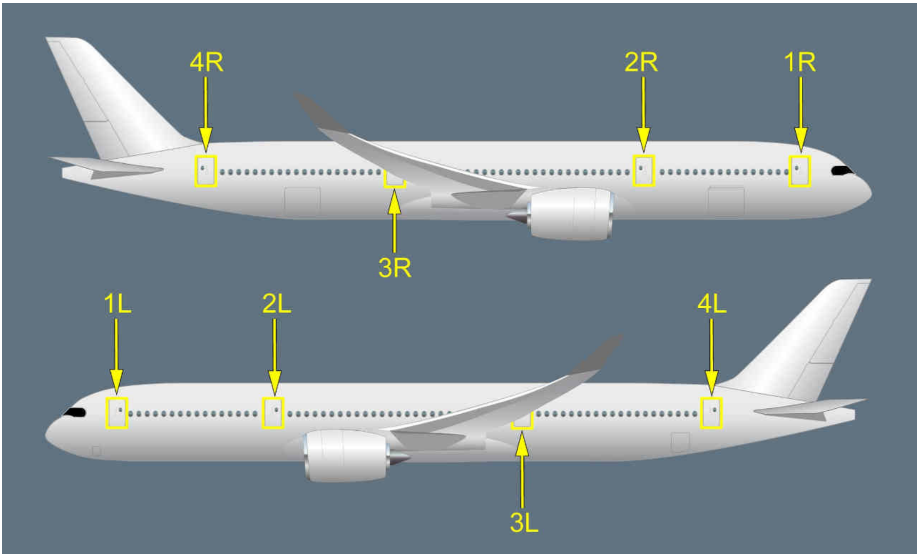
PASSENGER DOORS

Ident.: DSC-52-30-10-00002539.0001001 / 24 APR 14
Applicable to: ALL

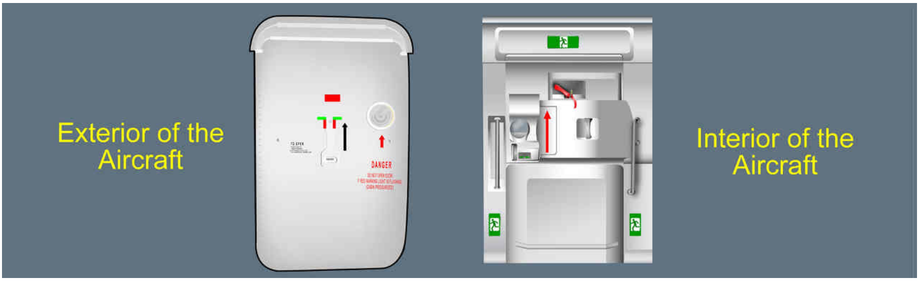
The aircraft has 8 passenger doors.

Door Arrangement



The doors open forward. The opening/locking of the door is performed mechanically by moving the door handle.

L3 The dimensions of the doors are :
- Doors 1, 2 and 4:
  - Width = 1.262 m,
  - Height = 2.164 m
- Door 3:
  - Width = 1.262 m
  - Height = 2.113 m.



ESCAPE SLIDES

Ident.: DSC-52-30-10-00024149.0001001 / 24 SEP 19
Applicable to: ALL

Each pair of doors is associated with a maximum number of passengers as follows:

Exit	Passenger exit pair rating
Type A+ (dual-lane slide)	120
Type A (dual-lane slide)	110
Type C (single-lane slide)	55

Depending on the aircraft configuration, each pair of door can be defined as follows:

Doors	Type A+	Type A	Type C
1L/1R	YES	YES	YES
2L/2R	YES	YES	YES
3L/3R	YES	YES	YES
4L/4R	YES	YES	NO

Door Control Handle

For the detailed operational procedures for door opening and closing, *Refer to CCOM/09-10-40-10-10 How to Open a Cabin Door/Exit from the Inside* and *Refer to CCOM/09-10-40-10-10 How to Close a Cabin Door/Exit from the Inside*.

WARNING	Do not open the door if the CABIN PRESSURE light is flashing on the door window (cabin pressurized).

HOW TO OPEN THE DOOR

In normal operation (i.e. no emergency evacuation), disarm the escape slide.
Lift the door control handle fully up to unlock the door.
Grasp one of the door assist handles and manually move the door in the forward direction until the door is latched in the fully open position.

HOW TO CLOSE THE DOOR

Grasp one of the door assist handles and manually move the door in the aft direction, and stop the movement when facing the door frame.
When the door is facing the door frame, pull the door inwards the door frame.
Lower the door control handle to lock the door.

ERRONEOUS ACTIVATION OF THE CABIN PRESSURE WARNING LIGHTS WITHOUT REAL RESIDUAL DIFFERENTIAL PRESSURE

Ident.: DSC-52-30-40-00024739.0001001 / 04 MAY 18
Applicable to: ALL

DESCRIPTION

At touchdown, as per design, the Cabin Pressure Control System (CPCS) automatically commands the opening of the Outflow Valves (OFVs) to reduce the differential pressure to a safe level, even with both packs in operation.
However, the sensors used to detect residual differential pressure for the CABIN PRESSURE WARNING lights have a defect and may temporarily send an erroneous message to the Doors and Slides Control System (DSCS), in charge of the activation of these lights.
This erroneous message may result in an erroneous activation of the CABIN PRESSURE WARNING lights on the cabin and cargo doors. Based on current event reports, this erroneous activation of the CABIN PRESSURE WARNING lights can last up to 30 min.

HOW TO CONFIRM THE ABSENCE OF RESIDUAL DIFFERENTIAL PRESSURE

Before cabin(cargo) door opening, if the CABIN PRESSURE WARNING lights flash, the flight crew must check that:

- There is no CAB PRESS EXCESS RESIDUAL DIFF PRESS ECAM alert triggered, and
- On the CAB PRESS SD page:
  - The DELTA P indication is 0 PSI, and
  - Both OFVs are indicated fully open.

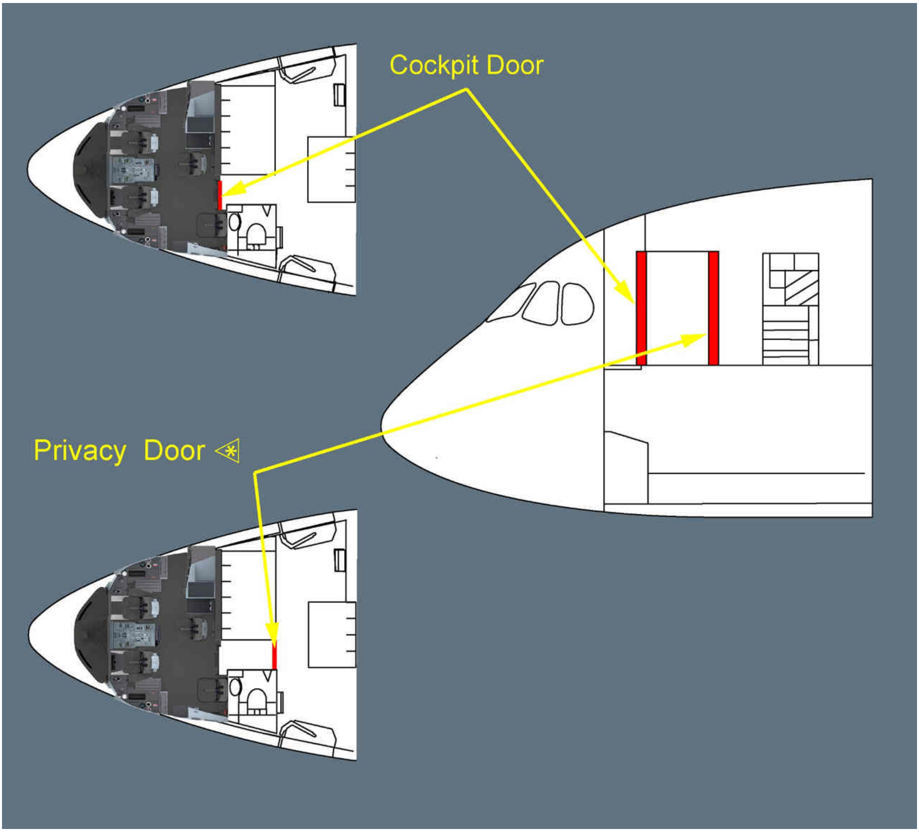
If all the above conditions are confirmed, the flight crew can order the cabin(ground) crew to open the cabin(cargo) doors regardless of the CABIN PRESSURE WARNING lights status.
After opening the cabin(cargo) doors, if the CABIN PRESSURE WARNING lights no longer flash, there is no need to make a technical logbook entry.
However, if the CABIN PRESSURE WARNING lights keep flashing after door opening, a technical logbook entry is necessary, as a DSCS failure may be the cause for the issue.

Intentionally left blank

OVERVIEW

Ident.: DSC-52-40-10-00001949.0002001 / 09 MAR 16

Applicable to: ALL



COCKPIT DOOR

Applicable to: ALL

Ident.: DSC-52-40-10-GCOCK-00001950.0001001 / 09 MAR 16

The cockpit door separates the cockpit from the cabin.

The cockpit door opens toward the cockpit.

The cockpit door automatically locks, as soon as it closes, when the Cockpit Door Locking System (CDLS) is powered.

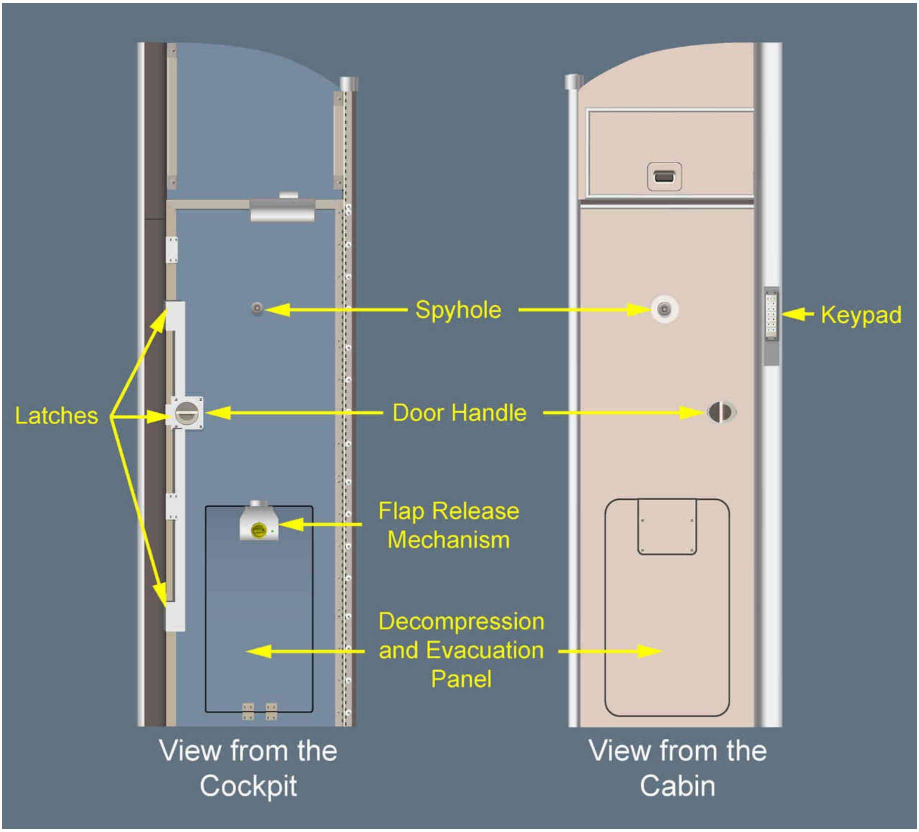
L2 The CDLS electrically locks and unlocks the cockpit door.

L1 If the CDLS fails, the door unlocks but remains closed.
The flight crew uses the CKPT DOOR sw to either open the cockpit door, or to refuse access to the cockpit.

L2 For more information on the CKPT DOOR sw, *Refer to DSC-52-40-20 CKPT DOOR sw*.

L1 At any time, the flight crew can use the door handle to manually open the cockpit door from the cockpit.

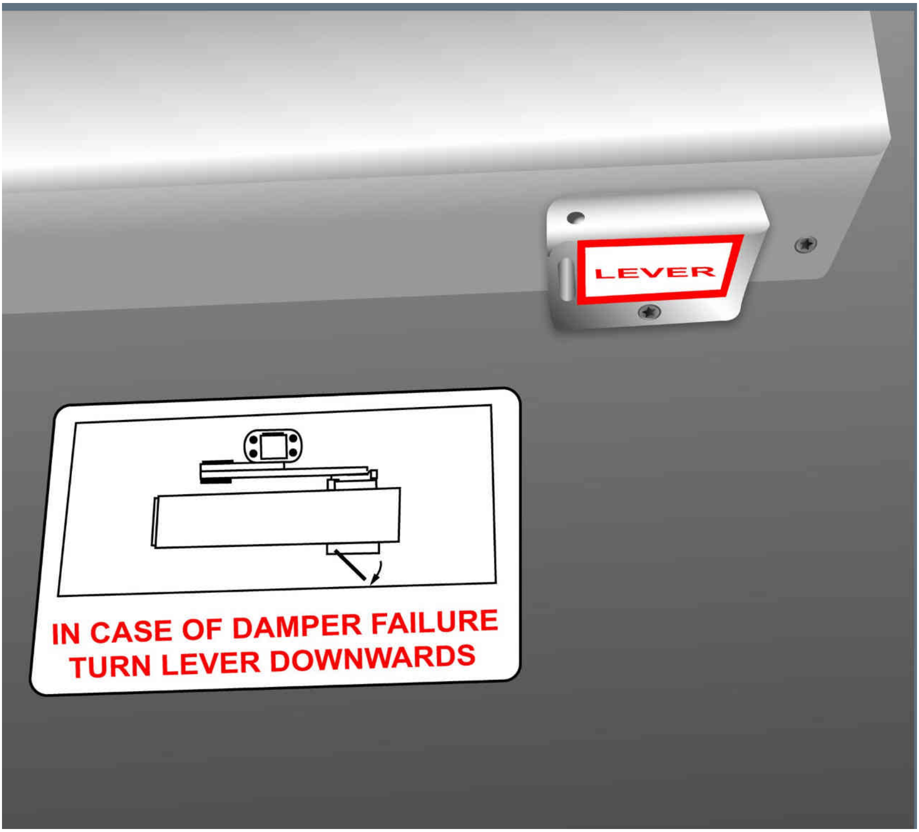
Cockpit Door Description



Spyhole
Keypad
Latches
Door Handle
Flap Release Mechanism
Decompression and Evacuation Panel
View from the Cockpit
View from the Cabin

L2 The cockpit door has a damper that slows down the door when the door is opened or closed. In the case of a damper blockage, the flight crew has to pull the lever to disengage the noise damper in order to close the door.

Noise Damper



LEVER
IN CASE OF DAMPER FAILURE
TURN LEVER DOWNWARDS

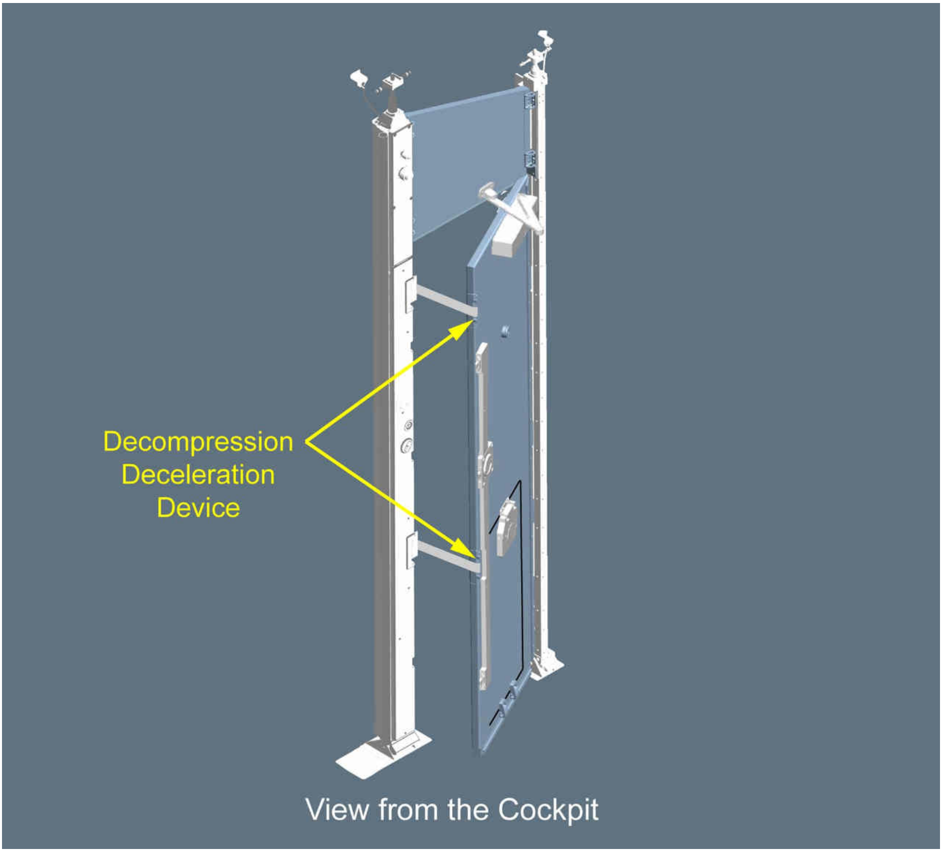
Ident.: DSC-52-40-10-GCOCK-00001953.0001001 / 24 APR 14

PROTECTION AGAINST DECOMPRESSION

In the case of a rapid decompression in the cockpit:

- Two pressure sensors on the CKPT DOOR CTLR panel detect the rapid drop of pressure.
  L2 For more information on the CKPT DOOR CTLR panel, *Refer to DSC-52-40-20 CKPT DOOR CTLR Panel*.
- L1 The cockpit door automatically opens.
  L3 The cockpit door automatically opens when the pressure drops by more than 10 PSI/s.
  L1 Two Decompression Deceleration Devices (DDDs) slow down the opening of the cockpit door. After decompression, the flight crew must pull the buckle away from the hook in order to exit the cockpit.

Decompression Deceleration Device



CAUTION	When the cockpit door is violently or rapidly opened, the DDDs can be triggered. Do not touch the DDDs, in order to prevent damage to these devices.

In the case of a rapid decompression in the cabin, the decompression and evacuation panel automatically opens toward the cabin.

L3 The decompression and evacuation panel automatically opens when the differential pressure between the cabin and the cockpit is above 0.58 PSI.

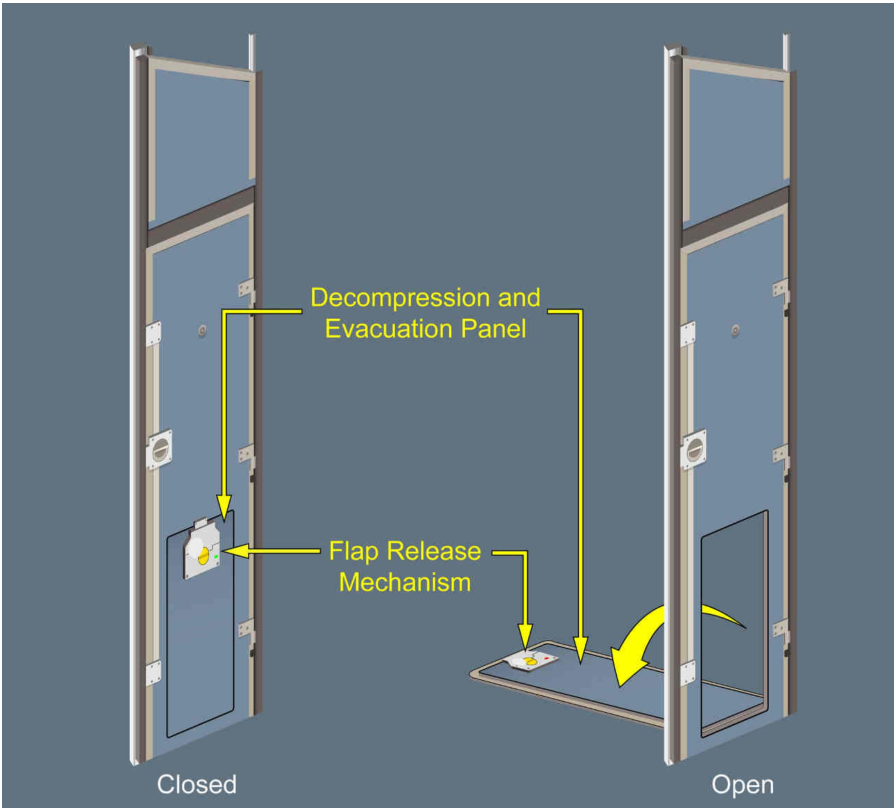
Ident.: DSC-52-40-10-GCOCK-00001954.0001001 / 09 MAR 16

DECOMPRESSION AND EVACUATION PANEL

The flight crew can evacuate the cockpit through the decompression and evacuation panel, when necessary.

The flight crew can manually operate the flap release mechanism in order to open the decompression and evacuation panel when:
- The cockpit door is jammed in the closed position
- An emergency situation occurs.

Decompression and Evacuation Panel

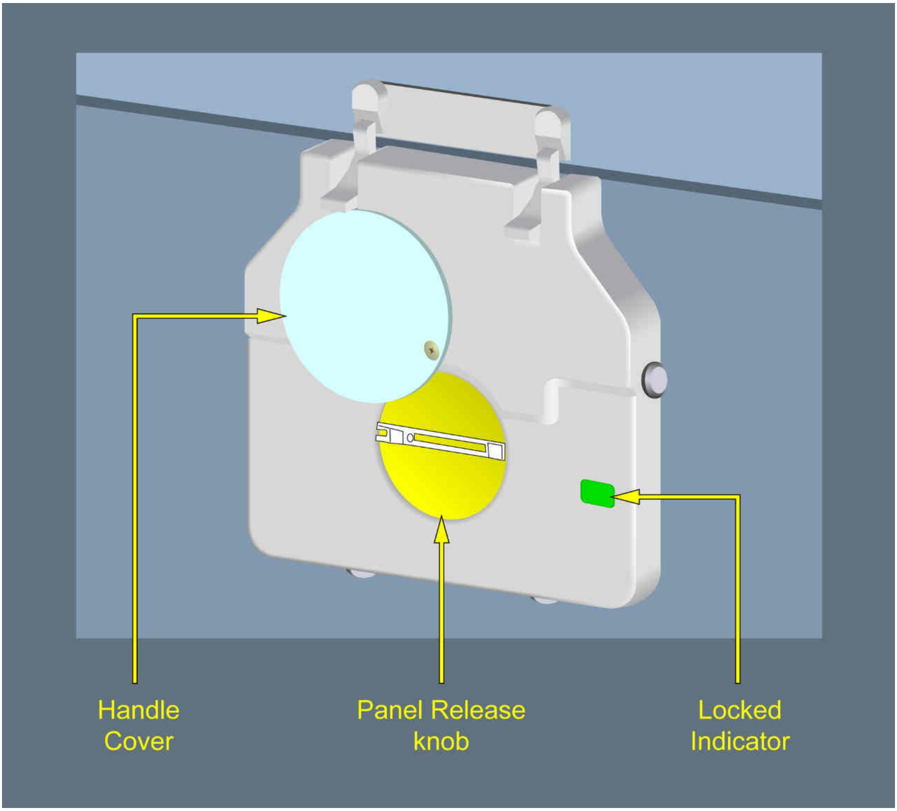


Decompression and Evacuation Panel
Flap Release Mechanism
Closed
Open

In order to open the decompression and evacuation panel the flight crew has to:

- Rotate the handle cover in order to access the panel release knob
- Push, then turn clockwise the panel release handle in order to unlock the decompression and evacuation panel
- Kick the decompression and evacuation panel toward the cabin.

Decompression and evacuation panel release mechanism



COCKPIT DOOR SURVEILLANCE SYSTEM ◁

Ident.: DSC-52-40-10-00011290.0001001 / 09 MAR 16
Applicable to: ALL

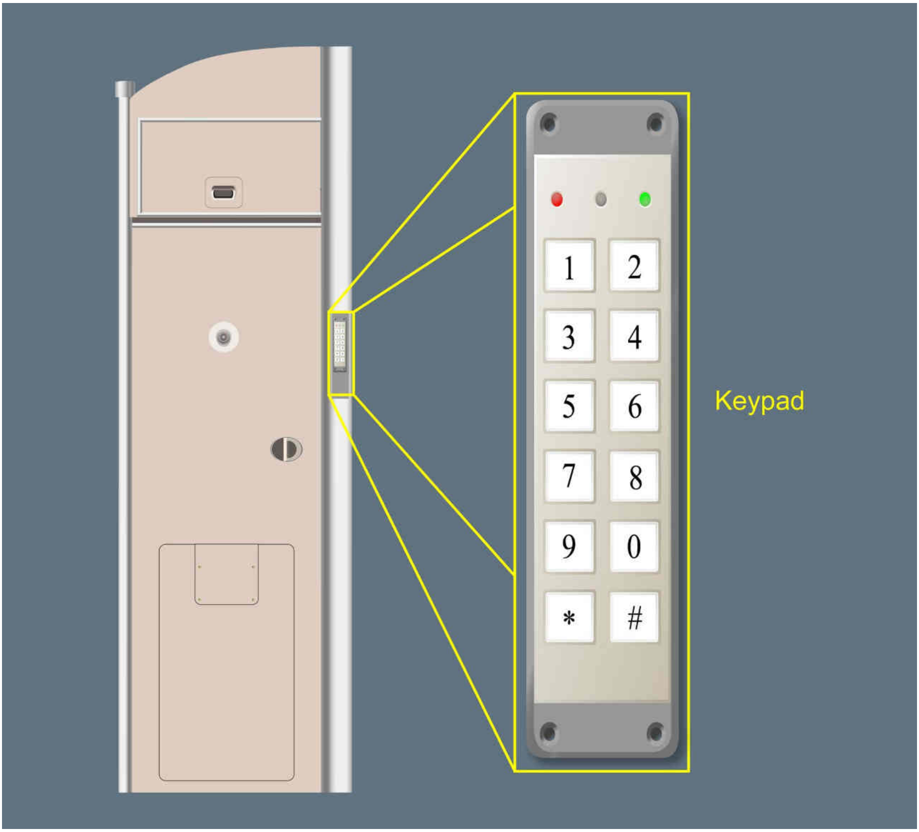
HOW TO OPERATE THE COCKPIT DOOR

Ident.: DSC-52-40-30-00002529.0001001 / 24 APR 14
Applicable to: ALL

The cabin crew uses the keypad to request access to the cockpit.



ROUTINE ACCESS (I.E. NORMAL ACCESS) REQUEST

To request access to the cockpit, enter the code, and validate it with the “#” key, on the keypad

L2 *The Operator defines this code (between 0 and 7 digits).*

L1 *A buzzer sounds in the cockpit for 2 s with a “DOOR PLEASE” audio indicator.*

Door Please (Sound and Synthetic Voice)

After identification of the person that requests access, unlock the door with the CKPT DOOR sw.

If the flight crew refuses access by setting the CKPT DOOR sw to LOCK, the keypad and the buzzer are inhibited for a defined period of time.
If the flight crew does not respond, the door remains locked.

EMERGENCY ACCESS REQUEST

To request emergency access to the cockpit, enter the emergency code, and validate it with the “#” key on the keypad.

L2 *The Operator defines this emergency code.*

L1 *A buzzer sounds in the cockpit until the flight crew unlocks, or locks the door by using the CKPT DOOR sw.*

Emergency Cockpit Door (Sound)

The DOOR CKPT DOOR EMER OPENING IN PROGRESS alert is also triggered (*Refer to procedure*).
After identification of the person that requests access, unlock the door with the CKPT DOOR sw.

If the flight crew refuses access by setting the CKPT DOOR sw to LOCK, the keypad and the buzzer are inhibited for a defined period of time.
If the flight crew does not respond, the door automatically unlocks for 5 s after a defined period of time.

EVACUATION THROUGH THE DECOMPRESSION AND EVACUATION PANEL

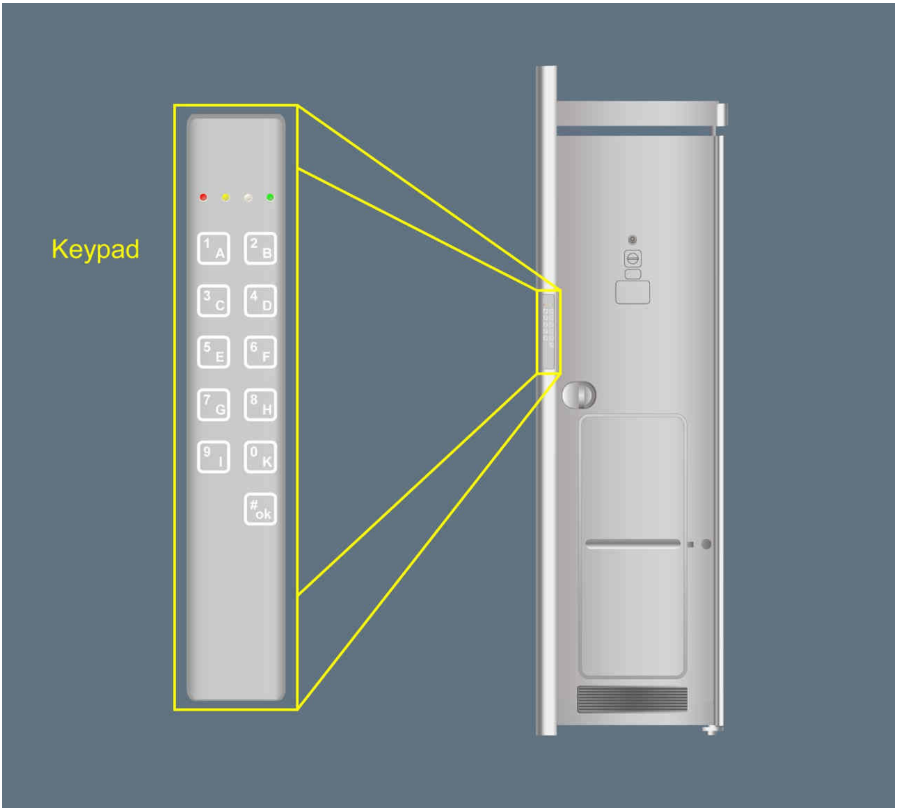
Rotate the handle cover to access the panel release knob.
Press then turn the panel release knob in order to unlock the decompression and evacuation panel.
Kick the decompression and evacuation panel toward the cabin.
Evacuate the cockpit on hands and knees.

HOW TO OPERATE THE PRIVACY DOOR ◁

Ident.: DSC-52-40-30-00013799.0001001 / 09 MAR 16
Applicable to: ALL

ACCESS TO THE PRIVACY AREA ◁ FROM THE CABIN SIDE

The crewmember uses the keypad to access to the cockpit privacy area.



To access the cockpit privacy area, type a code, and validate it with the "# OK" key on the keypad.

L2 *The Operator defines this code (minimum 5 digits).*

L1 When the door is unlocked, push the door toward the cockpit privacy area.

ACCESS FROM THE COCKPIT PRIVACY AREA

It is not necessary to enter an access code in order to unlock and open the door from the cockpit privacy area side.

To access the cabin:
- Press the Privacy Door Unlocking pb then pull the door toward the cockpit, or
- Slide the door handle to the left then pull the door toward the cockpit.

EMERGENCY ACCESS TO THE PRIVACY AREA ◁ FROM THE CABIN SIDE

Remove the cover plate from the door handle and operate the hook to mechanically open the door.

L2 For more information, *Refer to CCOM/16-02-80-40 PDLS override from the cabin side*.

L1 EMERGENCY ACCESS FROM THE COCKPIT PRIVACY AREA ◁

Release the two sliding latches on the decompression and evacuation panel in order to unlock the decompression and evacuation panel.
Kick the decompression and evacuation panel toward the cabin.
Evacuate the cockpit on hands and knees.

COCKPIT ESCAPE HATCH

Ident.: DSC-52-50-10-00013190.0001001 / 02 MAY 17
Applicable to: ALL

There is a cockpit escape hatch in the cockpit behind a removable ceiling panel.
The cockpit escape hatch is above the third occupant seat.
The hatch opens inward and can be operated from the inside and from the outside.

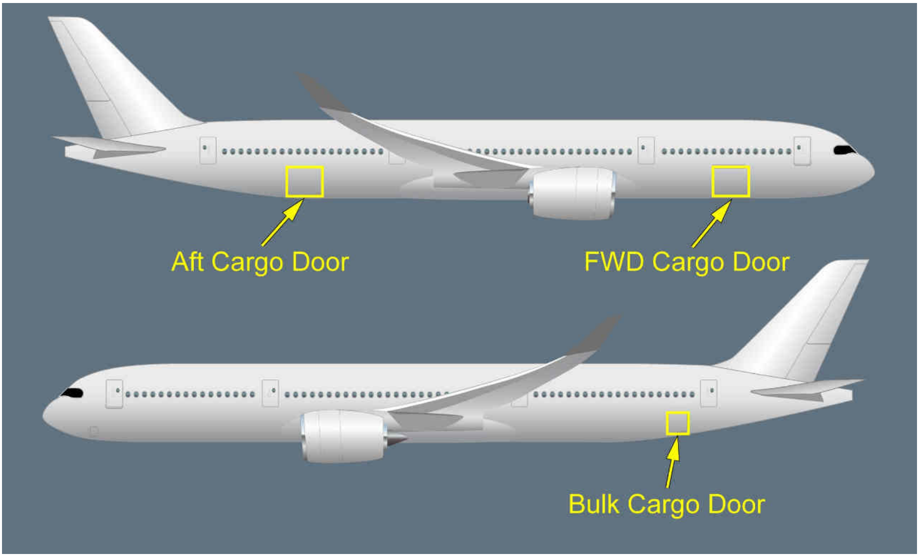
OVERVIEW

Ident.: DSC-52-60-10-00002566.0001001 / 24 APR 14
Applicable to: ALL

The aircraft has three cargo doors:
- One forward (FWD) cargo door
- One aft cargo door
- One bulk cargo door.

The forward and aft cargo doors are on the right hand side of the aircraft.
The bulk cargo door is on the left hand side of the aircraft.

Cargo Doors



FORWARD (FWD) AND AFT CARGO DOORS

Ident.: DSC-52-60-10-00002567.0001001 / 24 APR 14
Applicable to: ALL

The forward (FWD) and aft cargo doors provide access to the forward and aft cargo compartments, respectively.
Both the forward and aft cargo doors open outward and upward. They are mechanically locked, and hydraulically operated by the yellow hydraulic system.

The ground crew can manually lock and unlock the cargo doors with the door handle, from outside the aircraft.
The ground crew can use the NORMAL OPERATION sw to open and close the cargo doors via the hydraulic actuator. The NORMAL OPERATION sw is on the cargo door operation panel on the right side of each door (outside the aircraft).

In the case of an electrical or hydraulic pump failure, the ground crew can hydraulically open or close the cargo doors with:
- A lever for manual override on the cargo door operation panel
- A hand pump on the hydraulic maintenance panel.

When the door is fully open, and locked in the open position, a “FULLY OPEN AND ARRESTED” indicator on the cargo door operation panel comes on.

The cargo door operation is only possible when:
- The aircraft is on ground
- The engines are not running.

In the other cases, the cargo door operation is inhibited.
L3 When the cargo door operation is inhibited, the hydraulic actuator is isolated from the hydraulic system by an isolation valve. In this case, there is no power to open the door.

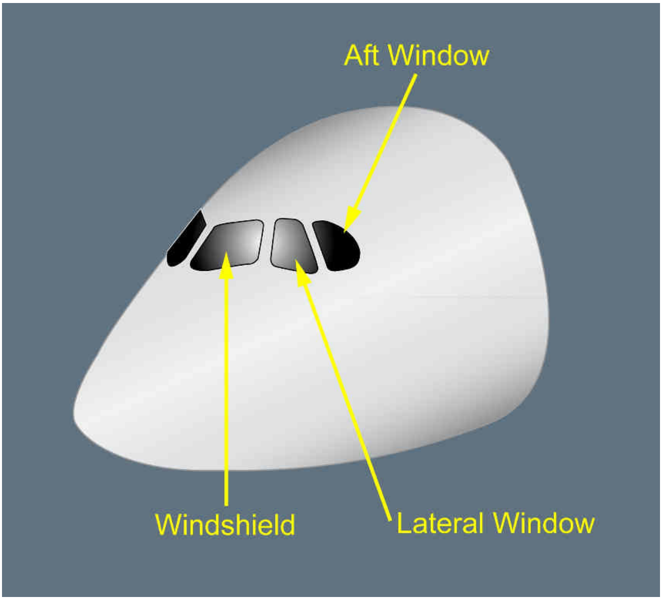
OVERVIEW

Ident.: DSC-56-10-00013357.0001001 / 07 NOV 16
Applicable to: ALL

The cockpit of the aircraft has:
- Two windshields
- Two fixed lateral windows
- Two fixed aft windows.

Cockpit Windows Overview



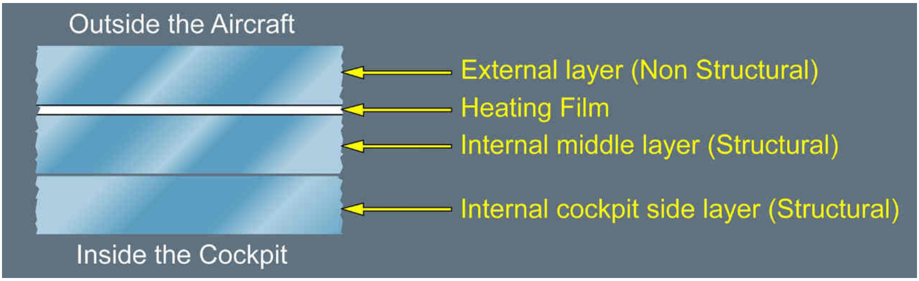
COCKPIT WINDSHIELDS AND WINDOWS

Ident.: DSC-56-10-00002998.0002001 / 03 JUL 20
Applicable to: ALL

1 Each windshield and each window has two internal layers, and one external layer. The external layer is not a structural layer. The two internal layers are structural layers. There is a heating film between the non-structural external layer and the structural internal layers (Internal middle layer and internal cockpit side layer).

Below is a horizontal section of a windshield or a window:

Horizontal Section of a Windshield or a Window



Outside the Aircraft
External layer (Non Structural)
Heating Film
Internal middle layer (Structural)
Internal cockpit side layer (Structural)
Inside the Cockpit

The heating film ensures:
- Defogging of the lateral and aft windows
- Defogging and deicing of the windshields.

L2 For more information, *Refer to DSC-30-20-10 Cockpit Window Heating*.

L1 Two heat bars power supply each heating film.

The illustration below indicates the position of the heat bars.

OVERVIEW

Ident.: DSC-70-10-10-00015301.0001001 / 14 JUN 16
Applicable to: ALL

The aircraft has two Rolls-Royce Trent XWB-84 engines that supply power to the aircraft.

L2 The Trent XWB-84 engine has the following two types of fan:
- Fan Mark I,
- Fan Mark II.

The performances of both engine types are similar, so engine intermix between Fan Mark I and Fan Mark II is possible.
Each engine provides up to 84 000 lb takeoff thrust at ISA sea-level conditions.

L1 Both engines are turbofan engines that have:
- A high bypass ratio
- A Full Authority Digital Engine Control (FADEC)
- A fuel system
- An oil system
- An air system
- A thrust reverser system
- An ignition system and a start system.

ENGINE

Applicable to: ALL

Ident.: DSC-70-10-20-10-00014197.0001001 / 06 NOV 14

The engine has:

- Three compressor turbine assemblies:
  - The Low Pressure (LP) compressor turbine assembly
  - The Intermediate Pressure (IP) compressor turbine assembly
  - The High Pressure (HP) compressor turbine assembly

L2 Each turbine operates its associated compressor via a shaft.

L3 The LP and the IP compressors turn clockwise, and the HP compressor turns counterclockwise.

L1
- One accessory gearbox
- One combustion chamber.

The engine operates as follows:

1. The LP compressor, referred to as the fan, compresses the air
2. Then, the air is divided into two flows:
   - Most of the air flows out of the core engine, and provides most of the engine thrust
   - The remaining air enters the core engine
3. The IP and the HP compressors compress the air that enters the core engine
4. The fuel is added to and mixed with the compressed air of the core engine. The mixture is ignited in the combustion chamber
5. The gas that results from combustion drives the HP, the IP, and the LP turbines.

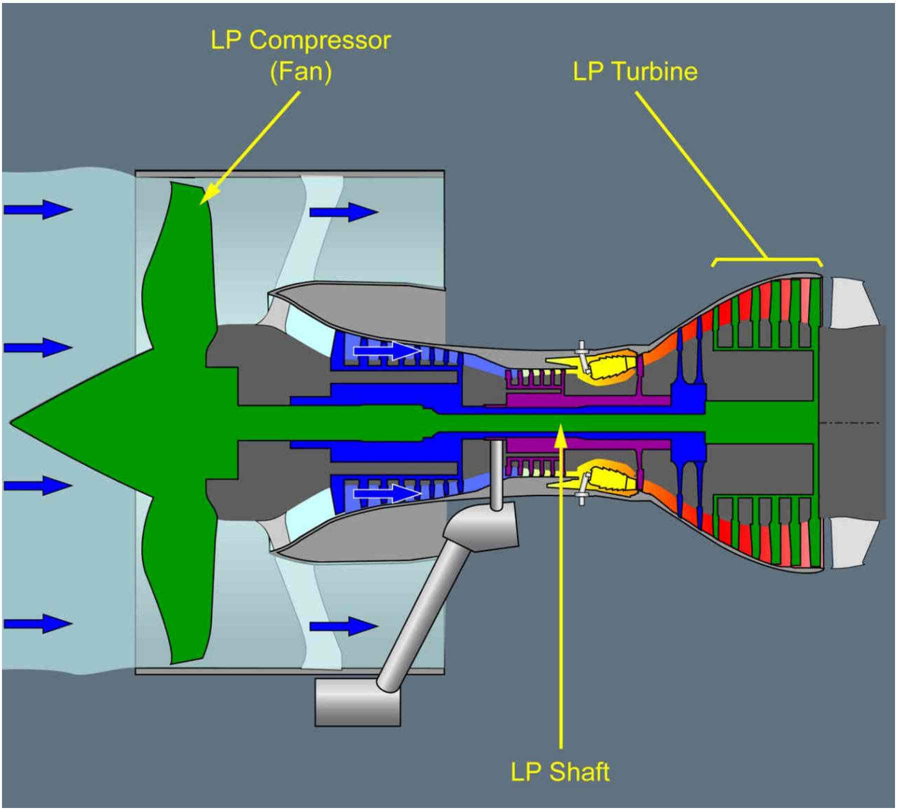
LP COMPRESSOR TURBINE ASSEMBLY

The LP compressor turbine assembly has:
- One LP compressor, referred to as the fan
- L2 - One LP shaft
- L1 - One LP turbine.

L2 The LP shaft connects the fan to the LP turbine.

LP Compressor Turbine Assembly



L3 The LP compressor (fan) has a single stage, and the LP turbine has 6 stages.

L1 The rotation speed of the fan provides the N1 engine parameter. The N1 engine parameter appears on the Engine Display (ED).

L2 The N1 engine parameter is the current rotation speed of the fan displayed in percentage.

L1 The FADEC uses the N1 engine parameter to:
- Control and monitor the engine
- Compute the applicable engine thrust.

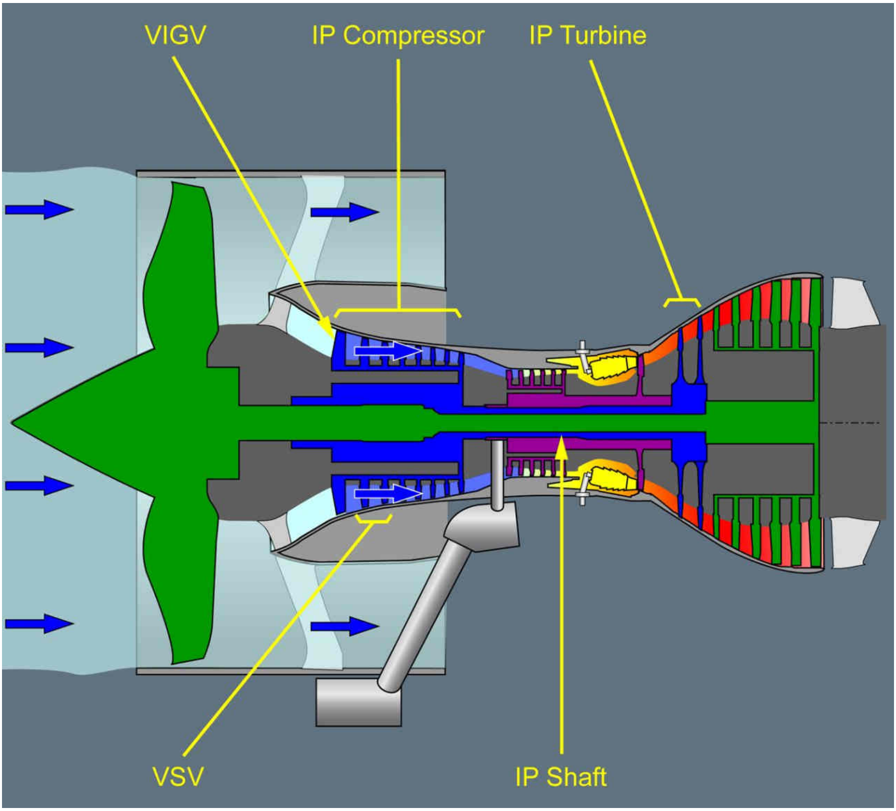
Ident.: DSC-70-10-20-10-00014199.0001001 / 23 APR 14

IP COMPRESSOR TURBINE ASSEMBLY

The IP compressor turbine assembly has:
- One IP compressor
- L2 One IP shaft
- L1 One IP turbine.

L2 The IP shaft connects the IP compressor to the IP turbine.

IP Compressor Turbine Assembly



L3 The IP compressor has 8 stages, and the IP turbine has 2 stages.
To optimize and protect the operation of the engine at all power settings and in all flight conditions, the Variable Inlet Guide Vanes (VIGVs) and the Variable Stator Vanes (VSVs) regulate the

quantity of air that flows through the IP compressor. For more information about the VIGVs and the VSVs, *Refer to DSC-70-10-30-20 Stall*.

L1 The rotation speed of the IP rotor provides the N2 engine parameter. The N2 engine parameter appears on the ENG SD page.

L2 The N2 engine parameter is the current rotation speed of the IP rotor displayed in percentage.

L3 The FADEC uses the N2 engine parameter for engine control and monitoring.

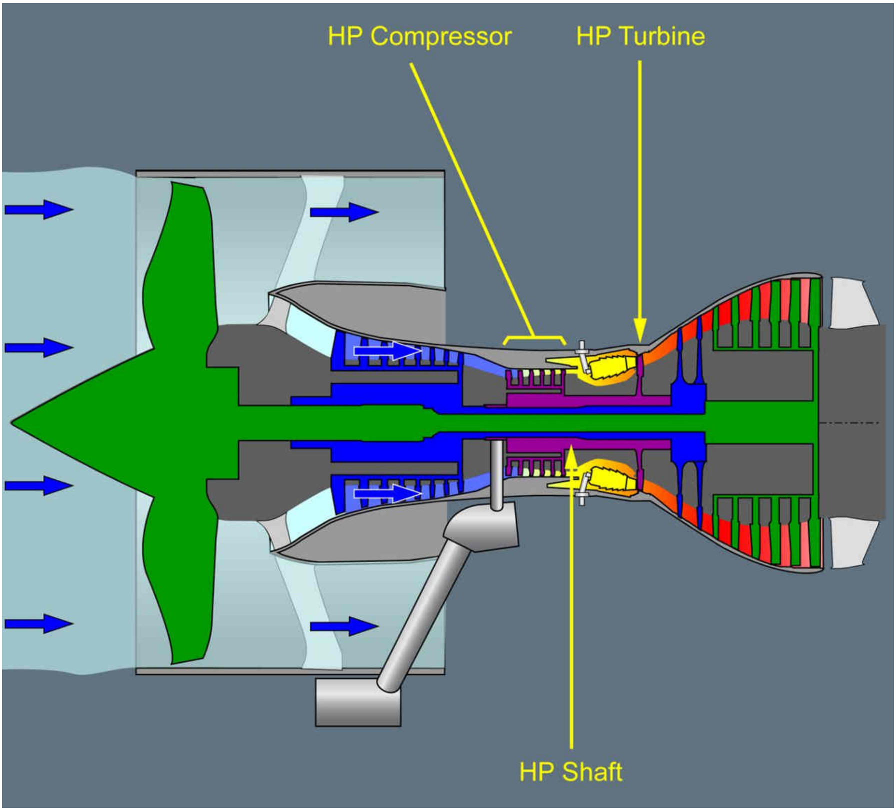
Ident.: DSC-70-10-20-10-00014200.0001001 / 23 APR 14

HP COMPRESSOR TURBINE ASSEMBLY

The HP compressor turbine assembly has:
- One HP compressor
- L2 One HP shaft
- L1 One HP turbine.

L2 The HP shaft connects the HP compressor to the HP turbine.

HP Compressor Turbine Assembly



L3 The HP compressor has 6 stages, and the HP turbine has a single stage.

L1 The rotation speed of the HP rotor provides the N3 engine parameter. The FADEC uses the N3 engine parameter for engine control and monitoring. The N3 engine parameter appears on the ENG SD page.

L2 The N3 engine parameter is the current rotation speed of the HP rotor displayed in percentage.

Ident.: DSC-70-10-20-10-00014201.0001001 / 23 APR 14

COMBUSTION CHAMBER

The combustion chamber burns a mixture of fuel and HP air. The FADEC controls the fuel/air mixture in accordance with the position of the thrust lever and the aircraft operating conditions.

L3 The combustion chamber is an annular assembly with fuel nozzles and two igniters.

The combustion chamber is between the HP compressor and the HP turbine.

Ident.: DSC-70-10-20-10-00014202.0001001 / 23 APR 14

ACCESSORY GEARBOX

The accessory gearbox drives various accessories with mechanical power via the HP shaft for the operation of the engine and the aircraft systems.

L2 The accessory gearbox of each engine operates:

- The oil feed pump that provides the oil system with oil. For more information, *Refer to DSC-70-10-50 Oil System*
- The main engine fuel pump that provides the combustion chamber with fuel. For more information, *Refer to DSC-70-10-40 Main Engine Fuel Pump*
- The engine-driven hydraulic pumps that pressurize the GREEN and the YELLOW hydraulic systems. For more information, *Refer to DSC-29-10 ENG Pumps*
- The engine-driven generators that are the primary source of electrical power. For more information, *Refer to DSC-24-10-20 Engine-driven Generators*
- The FADEC alternator that provides the FADEC with electrical power. For more information, *Refer to DSC-70-10-30-10 Electrical Supply*
- The pneumatic starter that enables the engine start. For more information, *Refer to DSC-70-10-80-30 Start System*.

Intentionally left blank

General

OVERVIEW

Ident.: DSC-70-10-30-10-00014863.0001001 / 23 APR 14
Applicable to: ALL

Each engine has a Full Authority Digital Engine Control (FADEC).

The FADEC :

- Manages engine power

L2 For more information, *Refer to DSC-70-10-30-30 Thrust Control*.

L1 - Provides engine protection

L2 For more information, *Refer to DSC-70-10-30-20 Engine Protection*.

L1 - Controls the engine fuel flow

L2 For more information about the engine fuel system, *Refer to DSC-70-10-40 Fuel System*.

L1 - Controls engine ignition and engine start.

L2 For more information about the ignition system and the start system, *Refer to DSC-70-10-80-10 General*.

ETRAC 1(2)

Each engine has one Electrical Thrust Reverser Actuation Controller (ETRAC).

L2 For more information, *Refer to DSC-70-10-70-10 Thrust Reverser Control*.

Ident.: DSC-70-10-30-10-10-00014867.0001001 / 23 APR 14

FADEC 1(2)

Each engine has one FADEC also called Engine Electronic Controller (EEC). The EEC controls the engine and computes the engine parameters for cockpit indications.

L3 Each EEC has two redundant channels: Channel A and channel B.
Only one EEC channel controls the engine at a time.
At each engine start, a different EEC channel is used (i.e. channel B if channel A was used during the last engine start).
If one EEC channel fails, the other EEC channel controls the engine.

Ident.: DSC-70-10-30-10-10-00014866.0001001 / 23 APR 14

EIF

Each engine has two Engine Interface Functions (EIF). The EIF is the main interface between the EEC and the other aircraft systems.

L2 The EIF:

- Controls the electrical supply to:
  - The EEC
  - The Engine Monitoring Unit (EMU)
  - The ETRAC
- Provides the EEC with the following data:
  - The air data
  - The bleed air data
  - The position of the thrust levers
  - The data of the cockpit panels
  - The commands in order to start the engine: The EIF monitors the actions of the flight crew, computes the appropriate commands in order to start the engine, and sends the commands to the EEC.
- Provides the aircraft systems (e.g. CDS) with the engine data.

L3 Four CPIOMs (two CPIOMs for each engine) host the EIF applications:

- For engine 1:
  - CPIOM J21: EIF 1.1
  - CPIOM J23: EIF 1.2
- For engine 2:
  - CPIOM J22: EIF 2.2
  - CPIOM J24: EIF 2.1.

Ident.: DSC-70-10-30-10-10-00015757.0001001 / 23 APR 14

EMU 1(2)

The aircraft has two Engine Monitoring Units (EMUs): One for each engine.
Each EMU monitors the vibrations data of its associated engine.

Ident.: DSC-70-10-30-10-10-00014864.0001001 / 23 APR 14

ELECTRICAL SUPPLY

The FADEC is electrically supplied as follows:

- The alternator of the FADEC supplies the FADEC when N3 is above 8 %
  L2 The accessory gearbox operates the FADEC alternator.
- L1 The electrical network of the aircraft supplies the FADEC:
  - When N3 is below 8 %, or
  - If the FADEC alternator fails.

  L3 The EIF controls and supplies the electrical power from the electrical network of the aircraft to the FADEC.

On ground, with the ENG MASTER lever set to OFF, the electrical network of the aircraft supplies the FADEC for 15 min.
When the flight crew sets the ENG FADEC GND PWR pb to ON, the electrical network of the aircraft supplies the FADEC for 15 min.

Engine Protection

ENGINE PROTECTION

Applicable to: ALL

Ident.: DSC-70-10-30-20-10-00014868.0001001 / 23 APR 14

The FADEC provides protection against the following engine malfunctions:

- Adverse weather
- Exhaust Gas Temperature (EGT) over limit
- Engine stall
- Fan instability
- LP and IP shaft rupture
- N1 and N2 overspeed
- Overthrust
- Burst duct.

ADVERSE WEATHER

Heavy rain or hail does not affect the operation of the engine.

In order to increase the engine protection in adverse weather conditions, the FADEC automatically:
- Turns on both igniters
- Defines the minimum HP compressor delivery temperature required to maintain combustor stability.

When weather conditions improve, the FADEC automatically:
- Turns off both igniters
- Returns to the initial HP compressor delivery temperature computation.

Ident.: DSC-70-10-30-20-10-00014870.0001001 / 23 APR 14

EGT OVER LIMIT

On ground during an automatic start sequence, if the FADEC detects that the EGT exceeds the temperature limit, the FADEC automatically shuts down the engine. The FADEC automatically initiates a second and last automatic sequence after an automatic crank process.

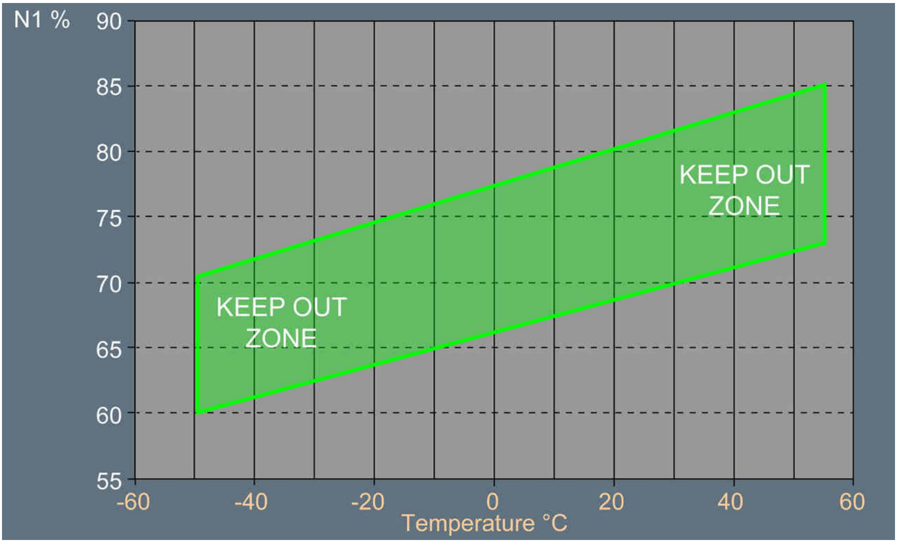
L2 For more information about automatic starts on ground that are automatically stopped, *Refer to DSC-70-40 Start Abort During Automatic Start*.

Ident.: DSC-70-10-30-20-10-00014874.0006001 / 29 JAN 19

FAN INSTABILITY

The EEC protects the engine against fan instability.
The fan instability depends on the aircraft speed and fan rotation speed (N1%).

L2 At aircraft speed below 60 kt, the EEC prevents stabilized operation in N1 Keep Out Zone (KOZ).
The KOZ is nominally from 67 % up to 78 % at 0 °C.



Ident.: DSC-70-10-30-20-10-00014871.0001001 / 23 APR 14

LP AND IP SHAFT FAILURE

In the case of an LP or an IP shaft failure between the compressor and the turbine, the FADEC automatically shuts down the engine.

L2 Associated with the following ECAM alert: ENG 1(2) FAIL (*Refer to procedure*).

Ident.: DSC-70-10-30-20-10-00014869.0001001 / 14 JUN 16

N1 AND N2 OVERSPEED

In the case of overspeed of the LP compressor, or the IP compressor, the FADEC automatically shuts down the engine.

L2 The FADEC automatically shuts down the engine if:
- N1 reaches 107.9 %, or
- N2 reaches 111.3 %.

Associated with the following ECAM alerts:
- ENG 1(2) N1 OVER LIMIT (*Refer to procedure*), or
- ENG 1(2) N2 OVER LIMIT (*Refer to procedure*).

Ident.: DSC-70-10-30-20-10-00014872.0001001 / 23 APR 14

OVERTHRUST

If the current engine thrust is above the commanded engine thrust, the FADEC ensures that the engine thrust remains within the safe limits.

The overthrust protection is active when:
- The aircraft is below 16 600 ft
- The aircraft speed is below M 0.45.

Depending on the aircraft altitude and the aircraft speed, if the FADEC detects overthrust, the FADEC:
- Shuts down the affected engine, or
- Reduces the thrust.

L2 The FADEC shuts down the affected engine if:
- The aircraft is on ground
- The flight crew sets the thrust lever associated with the affected engine to the idle (0) detent, or to the reverser position
- The flight crew sets the thrust lever associated with the other engine to, or below, the CL detent.

The FADEC reduces the thrust of the affected engine if the aircraft is in flight below 16 600 ft and M 0.45.

Ident.: DSC-70-10-30-20-10-00014873.0001001 / 30 APR 14

STALL

At low engine speeds, smooth airflow through the IP and the HP compressors is necessary to ensure that the engine does not stall.
To obtain smooth airflow, the FADEC regulates the volume of airflow through the IP and the HP compressors.

L2 The FADEC regulates the volume of airflow through the IP and the HP compressors via:

- The variable bleed valves that adjust the amount of airflow through the IP and the HP compressors

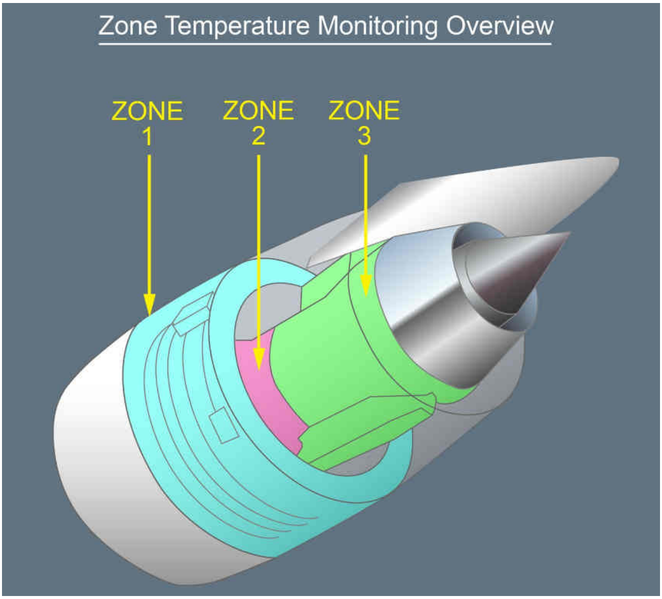
L3 For more information about the Variable Bleed Valves (VBVs), *Refer to DSC-70-10-60 Engine Stability*.

L2
- The Variable Inlet Guide Vanes (VIGVs) and the Variable Stator Vanes (VSVs) that adjust the angle at which the airflow enters the IP compressor.

Ident.: DSC-70-10-30-20-10-00016046.0001001 / 03 JUL 20

BURST DUCT - ENGINE ZONES TEMPERATURE MONITORING

Zones Temperature Monitoring Overview



1 FAN ZONE (ZONE 1)

The Propulsion Control System (PCS=EEC+EIF) monitors the temperature in the fan compartment in order to detect a potential leakage or burst duct.

- When the PCS detects an hot air leakage, the ENG 1(2) FAN ZONE AIR LEAK message is displayed on the DISPATCH page.
- When the PCS detects a burst duct, the EEC isolates the fan compartment from hot air.

L3 In order to isolate the fan compartment from hot air, the EIF orders:

- The anti-ice protection system to close the nacelle anti-ice valve
- The bleed air system to close the overpressure shutoff valve and the engine bleed valve.

L1 INTERMEDIATE CORE ZONE (ZONE 2)

The EEC compares the temperature measured in the upper section zone 2 with a fixed temperature threshold (200 °C) to detect if leak or burst duct event occurred in the region.

L2 When the PCS detects an hot air leakage, the ENG 1(2) INTERMEDIATE CORE ZONE AIR LEAK message is displayed on the DISPATCH page.

L1 CORE ZONE (ZONE 3)

The engine core zone temperature also called nacelle temperature parameter is no more displayed on the ENG SD page.
The engine core zone temperature is continuously monitored by the EEC.

L2 Associated with 2 levels of detection:

- ENG 1(2) CORE ZONE AIR LEAK LO message is displayed on the DISPATCH page, for the low level of detection.
- ENG 1(2) CORE ZONE AIR LEAK HI message is displayed on the DISPATCH page, for the high level of detection.

Power Management

THRUST CONTROL

Applicable to: ALL

Ident.: DSC-70-10-30-30-10-00014876.0001001 / 23 APR 14

The FADEC controls the engine thrust.

The FADEC controls the engine thrust in:
- Automatic mode: The FADEC computes the engine thrust in accordance with the A/THR target, or
- Manual mode: The FADEC computes the engine thrust in accordance with:
  - The position of the thrust levers
  - The air data
  - The use of engine bleed air.

The FADEC:
- Adjusts the fuel flow in order to control the engine thrust
- Computes the thrust rating limit in accordance with the position of the thrust levers.

Note: *The engine thrust is always limited by the thrust lever position, with or without A/THR, except when the* ***A.FLOOR*** *protection is active.*

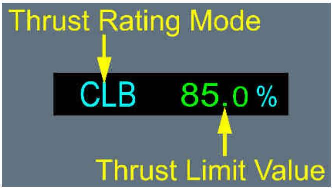
THRUST RATING MODE AND THRUST LIMIT VALUE

The FADEC computes the thrust rating mode and the corresponding thrust limit value in accordance with:

- The position of the thrust levers.
- The data that the flight crew entered in the T.O panel and the CLB panel of the FMS PERF page.

The thrust rating mode and the corresponding thrust limit value appear on the ED.

Thrust Rating Mode and Thrust limit Value



Thrust Rating Mode
CLB
85.0 %
Thrust Limit Value

THRUST LIMIT VALUE

The thrust limit value corresponds to the maximum available thrust of the engine with the current position of the thrust levers, the bleed configuration and the data entered in the FMS PERF page.

THRUST RATING MODE

The thrust rating modes are:

- TOGA: Takeoff or Go-Around mode
  The TOGA mode provides the maximum available thrust at takeoff or go-around.
  L2 For more information about the TOGA mode, *Refer to PER-TOF-20-10 TOGA Thrust*.
- L1 Dxx: Derated takeoff mode
  The Dxx takeoff mode reduces the thrust at takeoff.
  L2 For more information about the Dxx takeoff mode, *Refer to PER-TOF-20-20-30 Derated Takeoff Definition*.
  L1 The flight crew selects the level of the derated takeoff via the T.O panel of the FMS PERF page.
  L2 For more information about the selection of the derated takeoff, *Refer to DSC-22-FMS-20-20-20 T.O Thrust Option List*.
- L1 FLEX: Flexible (FLEX) takeoff mode
  The FLEX mode reduces the thrust at takeoff in order to limit the fuel consumption and the engine degradation.
  L2 For more information about the FLEX mode, *Refer to PER-TOF-20-20-20 Flexible Takeoff Definition*.
  L1 The flight crew selects the FLEX mode via the T.O panel of the FMS PERF page.
  L2 For more information about the selection of the FLEX mode, *Refer to DSC-22-FMS-20-20-20 T.O Thrust Option List*.
- L1 CLB: Climb mode (CLB)
  The CLB mode provides the maximum climb thrust during climb.
- DCLB: Derated climb mode reduces automatically the thrust during climb.
  L2 For more information, *Refer to DSC-22-FMS-10-50-40 Auto-Derated Thrust during Climb*
- L1 MCT: Maximum Continuous Thrust (MCT) mode.
  The MCT mode provides the maximum engine thrust with one engine inoperative
- GA SOFT: Go Around Soft mode provides:
  - The engine thrust to target a vertical speed at approximately 2 000 ft/min, or
  - The maximum available thrust (TOGA), if 2 000 ft/min target cannot be reached.

  L2 For more information, (*Refer to DSC-22-FG-50-60 From Soft Go-around to Thrust reduction Altitude*)

THRUST CONTROL IN MANUAL MODE

In manual mode, each FADEC computes the associated engine thrust based on the position of the corresponding thrust lever. The flight crew can move the thrust lever from the idle (0) detent to the TO/GA detent.
The position of the thrust lever corresponds to a specific percent of maximum thrust.

MANUAL THRUST ON GROUND (ENGINE RUNNING)

Depending on the data that the flight crew entered on the T.O panel of the FMS PERF page, the corresponding thrust rating mode (i.e. T.O, Dxx, or FLEX) appears on the ED, regardless of the position of the thrust levers.

Ident.: DSC-70-10-30-30-10-00014881.0001001 / 23 APR 14

THRUST CONTROL IN AUTOMATIC MODE

In automatic mode, i.e. when the A/THR is active, the FADEC computes the engine thrust in accordance with the A/THR target.

L2 The A/THR target is a N1 target.

L1 When the A/THR is active, the thrust rating mode is CLB.

L2 For more information about the A/THR, *Refer to DSC-22-FG-50-10 General*.
For more information about the A/THR arming and activation, *Refer to DSC-22-FG-50-30 Preliminary Conditions Required for A/THR Arming or Activation*.

L1 If the alpha floor protection activates, the A/THR requests TOGA thrust, regardless of the position of the thrust levers.

L2 For more information about the alpha floor protection, *Refer to DSC-22-27-20 Alpha Floor Protection*.

ENGINE POWER SETTINGS

Applicable to: ALL

Ident.: DSC-70-10-30-30-20-00014877.0001001 / 23 APR 14

The FADEC manages the engine thrust in:
- Normal mode
- Degraded mode.

Depending on the availability of the sources for the air data parameters, the FADEC selects the appropriate mode to manage the engine thrust.
In normal operations, the FADEC operates in normal mode.
If all ADIRUs and sensor data of one air data parameter (P0, P20, or T20) are not available, the FADEC reverts to degraded mode.
In both normal and degraded modes, the primary engine parameter for thrust management is N1.

Ident.: DSC-70-10-30-30-20-00014882.0001001 / 23 APR 14

NORMAL MODE

In normal mode, the primary engine parameter that appears on the ED is the thrust (THR).

The THR engine parameter is a specific percent of the maximum thrust that the engine can provide with:
- The engine bleed air system off
- The thrust levers set to the TO/GA detent.

L2 In order to compute the N1 engine parameter, the FADEC uses:
- The position of the thrust lever
- The following air data parameters:
  - Static pressure (P0)
  - Total pressure (P20)
  - Total temperature (T20).

Mach, AltΔ, ISA
Thrust Lever Position
Commanded N1 Computation
Commanded N1
Normal Mode Commanded N1 - Current N1
FADEC
Current N1
Fuel Flow Command

The FADEC uses the air data parameters to compute the aircraft speed, altitude, and ISA deviation that are then used for computation of the commanded N1.
The commanded N1 takes into account the current N1 value (N1 that the FADEC monitors).

Ident.: DSC-70-10-30-30-20-00014883.0001001 / 23 APR 14

DEGRADED MODE

In degraded mode, the N1 engine parameter appears on the ED instead of the THR engine parameter.

L2 For more information about display on the ED in degraded mode, *Refer to DSC-70-20 Degraded Thrust Indicator*.

L1 The FADEC uses the degraded mode to avoid thrust bump if all ADIRUs and one of the following air data parameters are not valid:
- Static pressure (P0), or
- Total pressure (P20), or
- Total temperature (T20).

If both engines operate in degraded mode, the A/THR automatically disconnects.
L2 The FADEC computes the N1 command from the position of the thrust levers.
L1 If one engine is in degraded mode, the soft go-around functions is lost.

SELECTION OF THE FADEC AIR DATA

The FADEC uses air data parameters for power management.
The three ADIRUs, the ISIS, and two probes dedicated to the engine provide the FADEC with the air data parameters.

L2 In accordance with the validity of the sources of the air data parameters, the FADEC selects the appropriate source for each air data parameter.

L3 In order to validate the source of each air data parameter, the FADEC compares the air data parameter of all the sources. The FADEC uses the air data parameter of the source that is most similar to the other sources.

L1 If there is no valid source for the corresponding air data parameter, the FADEC:
- Uses the engine parameters, or
- Reverts to degraded mode.

IDLE SETTINGS

Ident.: DSC-70-10-30-30-00014878.0001001 / 23 APR 14
Applicable to: ALL

When the flight crew sets the thrust lever to the idle (0) detent, depending on the flight phase, the EIF adjusts the minimum thrust required to maintain correct engine operation at low speeds.

There are three idle settings:

- Approach idle
  The approach idle setting enables to rapidly accelerate the engine from idle to go-around thrust, if needed.

L2 The EIF selects the approach idle setting when the aircraft is in flight and:
- The landing gear is extended, or
- The FLAPS lever is set to 2, 3 or FULL position.

L1 - Minimum reverse idle
  The minimum reverse idle setting enables to rapidly accelerate the engine from reverse idle to maximum reverse thrust.

L2 The EIF selects the minimum reverse idle setting when:
- The aircraft is on ground
- The flight crew selects the reverse thrust, via the thrust reverser lever.

L1 - Normal idle

L2 The EIF selects the normal idle setting in flight when:
- The FLAPS lever is set to 0, 1
- The landing gear is retracted.

The EIF selects the normal idle setting on ground when the flight crew does not select the reverse thrust.

Intentionally left blank

FUEL SYSTEM

Applicable to: ALL

Ident.: DSC-70-10-40-10-00014242.0001001 / 23 APR 14

The fuel system provides the combustion chamber with the fuel at the required flow rate, pressure, and temperature.

LP SHUTOFF VALVE

Each engine has a LP shutoff valve also called LP fuel valve.

The LP shutoff valve closes when the flight crew:
- Sets the ENG MASTER lever to OFF, or
- Presses the ENG FIRE pb.

When the LP shutoff valve closes, the fuel supply from the fuel tanks to the main engine fuel pump is stopped.

Ident.: DSC-70-10-40-10-00014243.0001001 / 23 APR 14

MAIN ENGINE FUEL PUMP

The main engine fuel pump provides the fuel nozzles with the fuel from the fuel tanks, at the required pressure and temperature.
The main engine fuel pump is a two-stage pump that has an LP stage and an HP stage.

LP PUMP

The fuel from the fuel tanks flows through the LP pump.
L3 The LP pump provides the FOHE with the fuel for temperature regulation purpose.

L1 HP PUMP

The fuel from the LP fuel filter flows through the HP pump to the fuel nozzles, via the HMU and the HP fuel filter.
L3 The HP pump pressurizes the fuel for pressure regulation purpose.

Ident.: DSC-70-10-40-10-00014251.0001001 / 02 OCT 14

FUEL/OIL HEAT EXCHANGER

The Fuel/Oil Heat Exchanger (FOHE) uses the cold LP fuel to decrease the temperature of the engine oil, and increases the temperature of the fuel.
The heat is continuously transmitted from the oil to the fuel when the engine is in operation. This prevents the fuel from icing.
If the FOHE is clogged (e.g. ice accretion from the upstream pipes), a bypass valve opens to ensure that the fuel continuously flows to the fuel nozzles.

L2 Associated with the following ECAM alert:
- ENG 1+2 FUEL HEAT EXCHANGER IN BYPASS (*Refer to procedure*).
- ENG 1(2) FUEL HEAT EXCHANGER IN BYPASS (*Refer to procedure*).

Ident.: DSC-70-10-40-10-00014244.0001001 / 02 OCT 14

LP FUEL FILTER

The LP fuel filter protects the fuel system from contamination.
L2 The LP fuel filter is downstream of the FOHE.

L1 If the LP fuel filter is clogged, a bypass valve opens to ensure that the fuel continuously flows to the fuel nozzles.
If the bypass valve opens, the fuel that flows through the HMU may be contaminated with particles.

L2 Associated with the following ECAM alerts:
- ENG 1(2) FUEL FILTER CLOGGED (*Refer to procedure*).
- ENG 1+2 FUEL FILTER CLOGGED (*Refer to procedure*).
- ENG 1(2) FUEL FILTER IN BYPASS (*Refer to procedure*).
- ENG 1+2 FUEL FILTER IN BYPASS (*Refer to procedure*), or
- ENG 1(2) CTL SYS FAULT (*Refer to procedure*).

Ident.: DSC-70-10-40-10-00014245.0001001 / 23 APR 14

HYDROMECHANICAL UNIT

The FADEC controls the fuel supply via the Hydromechanical Unit (HMU) to obtain the required engine thrust. The HMU commands the Fuel Metering Valve (FMV) to control the fuel that flows to the engine combustion chamber.

L3 The HMU:
- Controls the fuel flow to the combustion chamber via the FMV
- Operates the VSVs and the VIGVs to regulate the IP and the HP compressor flow. For more information about the VSVs and the VIGVs, *Refer to DSC-70-10-30-20 Stall*
- Operates the HP shutoff valve to start or stop the engine
- Closes the HP shutoff valve in order to prevent engine overspeed, or in the case of engine fire.

Ident.: DSC-70-10-40-10-00014250.0001001 / 23 APR 14

L3 SPILL VALVE

The spill valve regulates the fuel pressure upstream and downstream of the fuel metering valve.
The spill valve maintains a constant differential pressure through the fuel metering valve to ensure that the metered fuel flow is always in accordance with the fuel metering valve position.

Ident.: DSC-70-10-40-10-00014247.0001001 / 23 APR 14

HP SHUTOFF VALVE

Each engine has a HP shutoff valve also called HP fuel valve.
The HP shutoff valve closes when the flight crew sets the ENG MASTER lever to OFF.
When the HP shutoff valve closes, the fuel supply from the main engine fuel pump to the combustion chamber is stopped.

L3 When the HP shutoff valve closes, the drain valve opens. Any remaining fuel from the fuel nozzles is sent to the fuel drain via the drain valve.

L2 Associated with the following ECAM alerts:
- ENG 1(2) HP FUEL VLV NOT CLOSED (*Refer to procedure*), or
- ENG 1(2) HP FUEL VLV NOT OPEN (*Refer to procedure*).

Ident.: DSC-70-10-40-10-00014249.0001001 / 23 APR 14

L3 FUEL DRAIN SYSTEM

The fuel drain system drains and stores the fuel that did not burn after an engine shutdown or an aborted start sequence on the ground, via the drain valve.
During the engine start, the fuel from the fuel drain is transferred to the fuel drain system.
The LP fuel pump also uses fuel from the drain tank.

Ident.: DSC-70-10-40-10-00014248.0001001 / 23 APR 14

HP FUEL FILTER

The HP fuel filter protects the fuel nozzles against blockage.
L2 The HP fuel filter is upstream of the fuel nozzles.

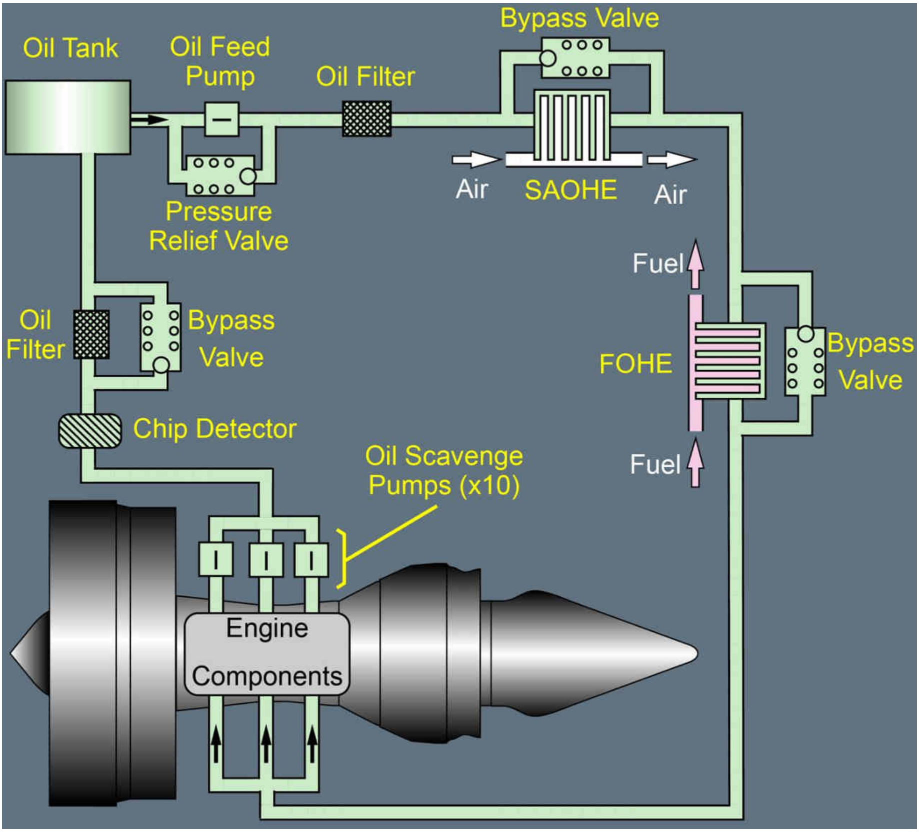
OIL SYSTEM

Applicable to: ALL

Ident.: DSC-70-10-50-10-00014252.0001001 / 23 APR 14

The oil system lubricates and cools the following engine components:
- The gears
- The bearings
- The accessory drivers.

Oil System



Oil Tank
Oil Feed Pump
Oil Filter
Bypass Valve
Pressure Relief Valve
Air
SAOHE
Air
Fuel
Oil Filter
Bypass Valve
FOHE
Bypass Valve
Chip Detector
Oil Scavenge Pumps (x10)
Fuel
Engine Components

Ident.: DSC-70-10-50-10-00014254.0001001 / 23 APR 14

OIL FEED PUMP

The oil feed pump supplies the oil to lubricate the engine components.

Ident.: DSC-70-10-50-10-00014255.0001001 / 23 APR 14

PRESSURE RELIEF VALVE

The pressure relief valve opens to decrease the oil pressure if:
- The oil pressure is too high at the oil feed pump outlet, or
- The oil filter is clogged.

L3 When the oil temperature is low, or there is a blockage in the system, the oil pressure increases. Therefore, to protect the oil system, the pressure relief valve opens when the oil pressure is too high. When the pressure relief valve opens, the oil is fed back to the oil feed pump inlet.

Ident.: DSC-70-10-50-10-00014256.0001001 / 23 APR 14

OIL FILTER

The oil system has two filters to protect the oil system from contamination:
- One system oil filter downstream of the oil feed pump
- One scavenge oil filter upstream of the oil tank.

Only the scavenge oil filter has a bypass valve.
L3 If the scavenge oil filter is blocked, the bypass valve opens to ensure that the oil continuously flows to the engine components.

Ident.: DSC-70-10-50-10-00014257.0001001 / 23 APR 14

L3 SURFACE AIR/OIL HEAT EXCHANGER

The Surface Air/Oil Heat Exchanger (SAOHE) uses cold air to cool the oil before it flows to the FOHE.

The SAOHE has a bypass valve. The FADEC controls the bypass valve as follows:
- If the temperature of the oil is above a specific value, the FADEC closes the bypass valve. The oil flows through the SAOHE
- If the temperature is below a specific value, the FADEC opens the bypass valve. The oil directly flows to the FOHE.

Ident.: DSC-70-10-50-10-00014259.0001001 / 23 APR 14

OIL SCAVENGE PUMPS

The oil scavenge pumps send the oil that lubricates the engine components to the oil tank.

Ident.: DSC-70-10-50-10-00014260.0001001 / 23 APR 14

CHIP DETECTOR

The chip detector detects any particles in the oil, and so provides an indication of the state of the engine components.
The chip detector is downstream of the oil scavenge pumps.

Intentionally left blank

AIR SYSTEM

Applicable to: ALL

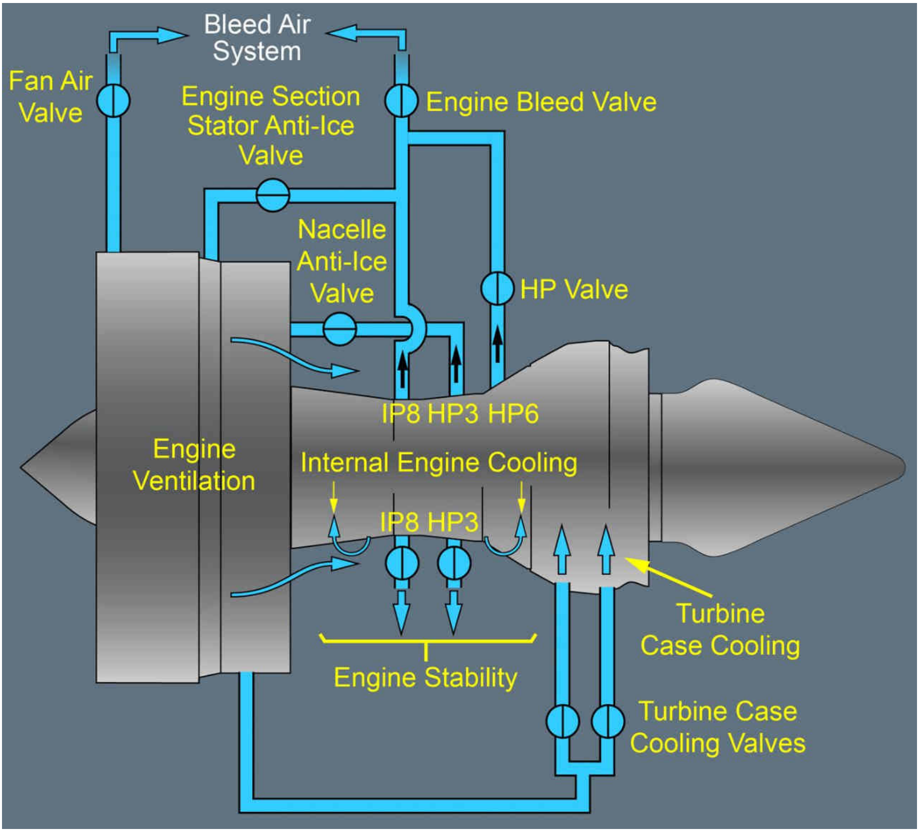
Ident.: DSC-70-10-60-10-00014262.0001001 / 03 JUL 20

1

The engines provide bleed air to ensure:
- The internal engine cooling
- The engine stator section de-icing
- The turbine case cooling to improve the turbine efficiency.
- L3 The engine stability via the control of the volume of airflow in the IP and HP compressors.

L1 The engines also provide bleed air to:
- The bleed air system
  (*Refer to DSC-36-10-20 Engine Bleed Air System*).
- The engine anti-ice system.
  (*Refer to DSC-30-20-10 Engine Anti-ice*).

Air System



Bleed Air System
Fan Air Valve
Engine Section Stator Anti-Ice Valve
Engine Bleed Valve
Nacelle Anti-Ice Valve
HP Valve
IP8 HP3 HP6
Engine Ventilation
Internal Engine Cooling
IP8 HP3
Turbine Case Cooling
Engine Stability
Turbine Case Cooling Valves

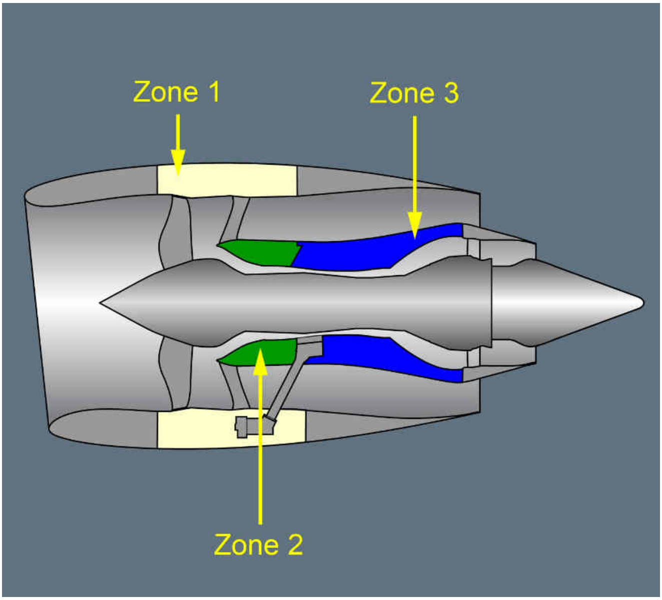
Ident.: DSC-70-10-60-10-00014263.0001001 / 23 APR 14

ENGINE VENTILATION

The engine has three fire resistant zones that are isolated from each other:
- Zone 1: The fan compartment
- Zone 2: The IP compressor compartment
- Zone 3: The engine core compartment.

The airflow:
- Decreases the temperature of these three zones
- Prevents the accumulation of fumes.

Engine Zones



Ident.: DSC-70-10-60-10-00014264.0001001 / 23 APR 14

INTERNAL ENGINE COOLING

The internal part of the engine is cooled with air from the IP and the HP compressors.

L3 The air from the IP and the HP compressors also:
- Seals the bearing chambers
- Prevents any internal oil leakage.

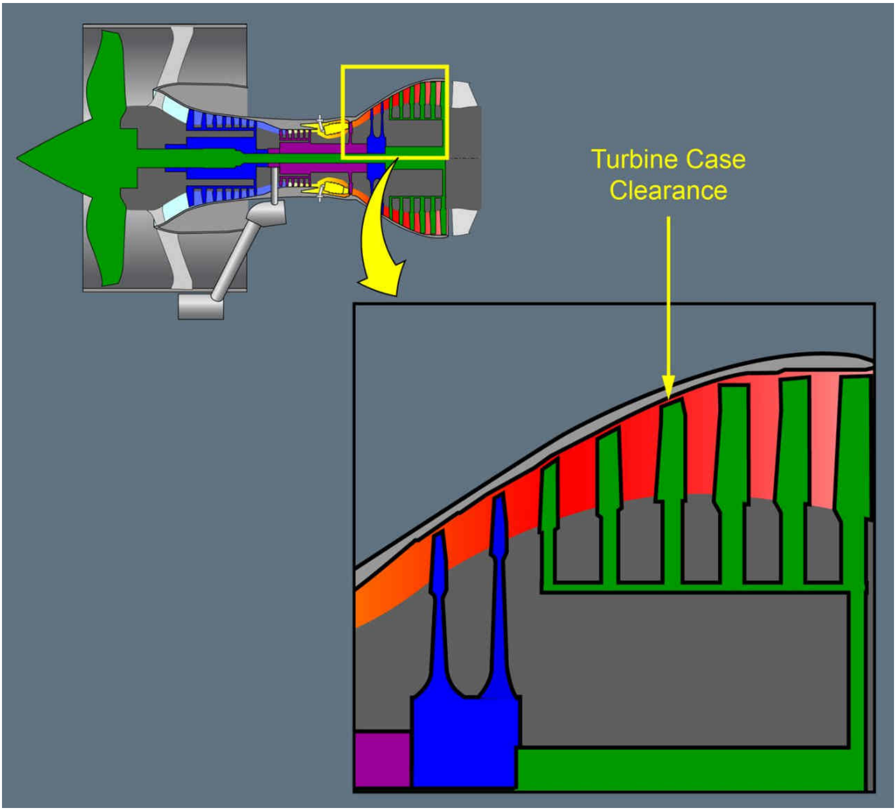
Ident.: DSC-70-10-60-10-00014265.0001001 / 23 APR 14

TURBINE CASE COOLING

The turbine case cooling improves the turbine efficiency.

L3 The turbine case cooling reduces the clearance of the turbine blade tip to optimize the engine performance.
The FADEC controls the turbine case cooling via the turbine case cooling valves.
When the turbine case cooling valves open, the air goes to three manifolds to cool the LP, the IP, and the HP turbine cases.

Turbine Case Clearance



Ident.: DSC-70-10-60-10-00014266.0001001 / 23 APR 14

L3 ENGINE STABILITY

The air system ensures the engine stability via the control of the airflow through the IP and the HP compressors.

The FADEC controls the volume of the airflow through the IP and the HP compressors via:

- The bleed valves at the 8th stage of the IP compressor, and at the third stage of the HP compressor
  At low engine speeds, the FADEC opens the Variable Bleed Valves (VBVs) to deviate some airflow out of the core engine.
  At high engine speeds, the FADEC closes the VBVs to supply the full airflow to the IP and the HP compressors.
- The VSVs and the VIGVs on the IP compressor.
  For more information about the VSVs and the VIGVs, *Refer to DSC-70-10-30-20 Stall*.

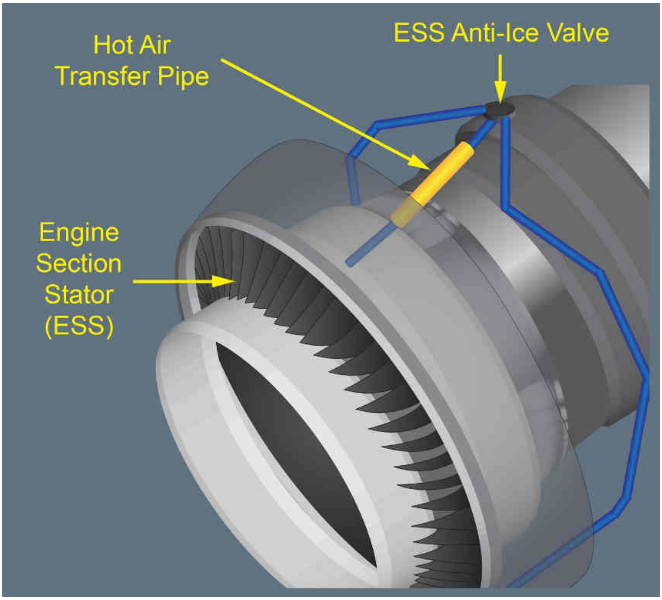
Ident.: DSC-70-10-60-10-00019021.0001001 / 25 JUN 14

ENGINE SECTION STATOR ANTI-ICE SYSTEM

The Engine Section Stator (ESS) anti-ice system prevents ice accretion at compressor inlet to avoid engine core damages.

L2 Hot air from intermediary pressure compressor is bled and piped to the engine section stator to warm the aerofoil surfaces and prevent buildup of ice.

Engine Section Stator Anti-Ice System



L1 ENGINE SECTION STATOR ANTI-ICE VALVE

The Engine Section Stator Anti-Ice Valve (ESS A-ICE VLV) is automatically controlled and monitored.

L2 The ESS A-ICE VLV is spring loaded (failed safe position), and HP muscle air is used to drive the valve open.
Associated with the following ECAM alert: ENG 1(2) STATOR A-ICE VLV CLOSED (*Refer to procedure*).

L1 HOT AIR TRANSFER PIPE

There are 3 hot air transfer pipes.

L2 The hot air transfer pipes bring hot air from IP compressor to the Engine Section Stator (ESS).

General

OVERVIEW

Applicable to: ALL

Ident.: DSC-70-10-70-10-10-00014943.0001001 / 23 APR 14

Each engine has one thrust reverser system.

The thrust reversers enable the reduction of:
- The landing distance
- The energy that the brakes absorb during landing.

Each thrust reverser system has two electrical translating cowls.

On ground, the thrust reversers open to obtain a reverse thrust when the flight crew sets:
- The thrust lever to the idle (0) detent
- The thrust reverser lever to the reverse thrust positions, i.e. between the minimum and maximum reverse detents.

The thrust reverser lever is mechanically locked when the flight crew sets the associated thrust lever above the idle (0) detent.

Overview

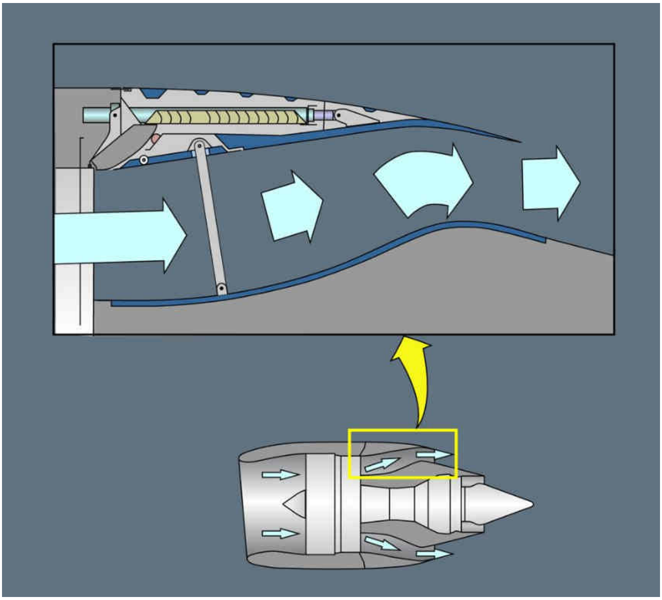
Translating Cowls
Thrust Reverser Control
Deployed Thrust Reversers

Ident.: DSC-70-10-70-10-10-00014944.0001001 / 23 APR 14

STOWED THRUST REVERSERS

When the thrust reversers are in the stowed position:
- The translating cowls are closed and mechanically locked
- The airflow outside the core engine continues to move through the engine exhaust.

Stowed Position



Ident.: DSC-70-10-70-10-10-00014945.0001001 / 23 APR 14

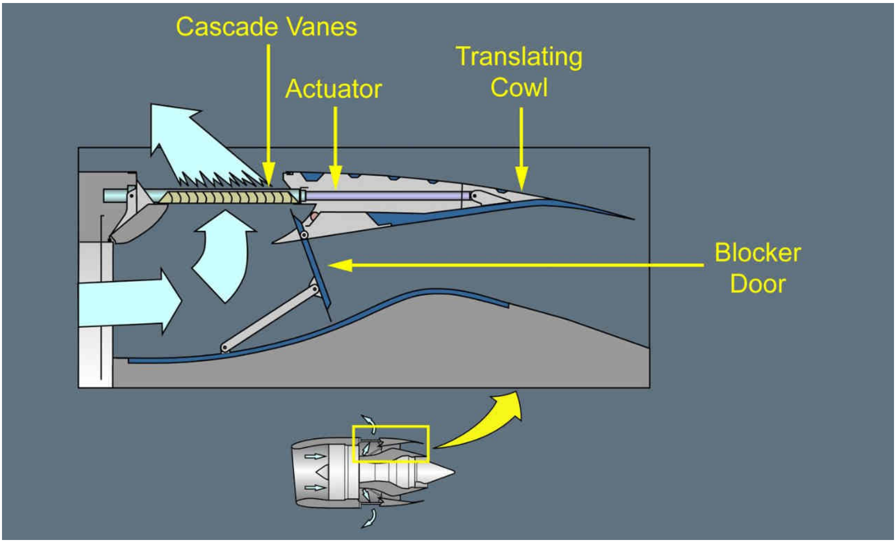
DEPLOYED THRUST REVERSERS

When the thrust reversers are in the deployed position, the airflow that goes outside the core engine is deviated forward as follows:

1. The translating cowls move backward
2. The blocker doors rotate
3. The airflow is deviated forward through the cascade vanes.

Note: *The actuators enable the deployment of the thrust reversers.*

Deployed Position



Ident.: DSC-70-10-70-10-10-00014946.0001001 / 23 APR 14

THRUST REVERSER CONTROL

The Electric Thrust Reverser Actuation System (ETRAS) operates and locks the translating cowls. During operation of the thrust reversers, the Electrical Thrust Reverser Actuation Controller (ETRAC) controls the translating cowls in order to put the thrust reversers in the deployed or stowed position.
The EIF sends the deploy or the stow command to the ETRAC.
The EIF sends the electrical supply command to the EPDC, which delivers power supply to the ETRAC.

L3 The ETRAC controls the translating cowls via six actuators. Each translating cowl has three actuators:
- The non-locking actuator
- The locking actuator
- The locking feedback actuator.

The locking actuator and the locking feedback actuator provide the primary locking devices through the Primary Locking System (PLS). These locking actuators provide the first and the second lines of defense of the thrust reverser system.

The thrust reverser system has one other locking device that provides the third line of defense. This locking device is referred to as the track lock.

L1 The ETRAC monitors and controls the first and the second lines of defense, and the PRIM & SEC control the third line of defense.

L2 For more information about the three lines of defense, *Refer to DSC-70-10-70-20 Three Lines of Defense*.

L3 When the thrust reversers deployment is commanded, the translating cowls operate in the following sequence:

1. The ETRAC controls both electric motors, and supplies these motors with electrical power Each translating cowl has one electric motor.
2. Each electric motor provides the non-locking actuator with mechanical power via the associated flexible shaft
3. Each non-locking actuator provides the locking actuator and the locking feedback actuator with mechanical power via the associated flexible shafts.

Protection of the Thrust Reverser System

PROTECTION OF THE THRUST REVERSER SYSTEM

Applicable to: ALL

Ident.: DSC-70-10-70-20-10-00014948.0001001 / 23 APR 14

The thrust reverser system has the two following types of protection in order to ensure that the FADEC does not deploy the thrust reversers in flight:

- Three lines of defense
  For more information, *Refer to Three Lines of Defense*.
- Idle protection.
  For more information, *Refer to Idle Protection*.

The thrust reverser lever is mechanically locked when the associated throttle lever is not in the IDLE detent.

Ident.: DSC-70-10-70-20-10-00014949.0001001 / 23 APR 14

THREE LINES OF DEFENSE

The thrust reverser system has three lines of defense in order to ensure that the EIF does not deploy the thrust reversers in flight.
The three lines of defense must be cleared in order to enable the deployment of the thrust reversers.

L2 *Note:* *If the thrust reverser lever is used in flight, the ENG REVERSER SELECTED alert is displayed on the WD. Refer to procedure.*

The ETRAC monitors and controls the first and the second lines of defense, and the PRIM & SEC controls the third line of defense through the RCCB of the EPDC. The third line of defense (track lock) is monitored by the EEC which send the status to the EIF.

FIRST AND SECOND LINES OF DEFENSE

The first and the second lines of defense are automatically cleared when:

- The flight crew sets the thrust reverser lever to the reverse thrust positions
- The aircraft is on ground.

L3 The EIF sends the electrical supply command to the RCCB which energize the ETRAC.
When the condition to clear the third line of defense (track lock released) is satisfied, the EIF sends the deploy command to the ETRAC to unlock the PLS and drive the electric motors.

THIRD LINE OF DEFENSE

The third line of defense is automatically cleared when:

- The flight crew sets the thrust reverser lever to the reverse thrust positions
- The aircraft is on ground.

L3

When the conditions to clear the third line of defense are satisfied, the PRIM & SEC provide the track lock with electrical power through the SSPC of the EPDC.

Note: *The PRIM & SEC do not use the same sources as the FADEC and the EIF to detect:*

- *The aircraft is on ground*
- *The position of the thrust reverser lever.*

IDLE PROTECTION

If the FADEC detects an inadvertent deployment of the thrust reversers, the FADEC automatically limits the associated engine thrust to idle.

L3 The FADEC detects an inadvertent deployment of the thrust reversers if:
- The translating cowls are open by 5 %
- The thrust reverser lever is not set to the reverse thrust positions.

Intentionally left blank

Deployment and Stowage

THRUST REVERSER DEPLOYMENT

Ident.: DSC-70-10-70-30-00014951.0001001 / 23 APR 14
Applicable to: ALL

The deployment of the thrust reversers starts when the three lines of defense are cleared (i.e. the aircraft is on ground and the flight crew sets the thrust reverser lever to the reverse thrust position).

L3 The EIF sends the electrical supply command to the RCCB which energize the ETRAC.
When the condition to clear the third line of defense (track lock released) is satisfied, the EIF sends the deploy command to the ETRAC to unlock the PLS and drive the electric motors.
For more information about the three lines of defense, *Refer to DSC-70-10-70-20 Three Lines of Defense*.

L1 During thrust reverser deployment phase, the engine thrust is limited by reverse idle thrust.

L3 Reverse thrust is only available when the translating cowls open by 85 %. This process lasts 2 to 3 s.
The idle thrust limits the loads on the thrust reverser system, and provides protection against the possibility of an engine stall.

L1 When the thrust reverser is deployed, the engine increases the reverse thrust in order to reach the selected engine thrust depending on the position of the thrust reverser lever.

THRUST REVERSERS STOWAGE

Ident.: DSC-70-10-70-30-00014952.0001001 / 23 APR 14
Applicable to: ALL

The stowage of the thrust reversers starts when the flight crew sets the thrust reverser lever forward the minimum reverse idle (0) detent.
When the thrust reverser reaches the stowed position, the primary locks and the track lock engage.

Intentionally left blank

General

GENERAL

Ident.: DSC-70-10-80-10-00014514.0001001 / 23 APR 14
Applicable to: ALL

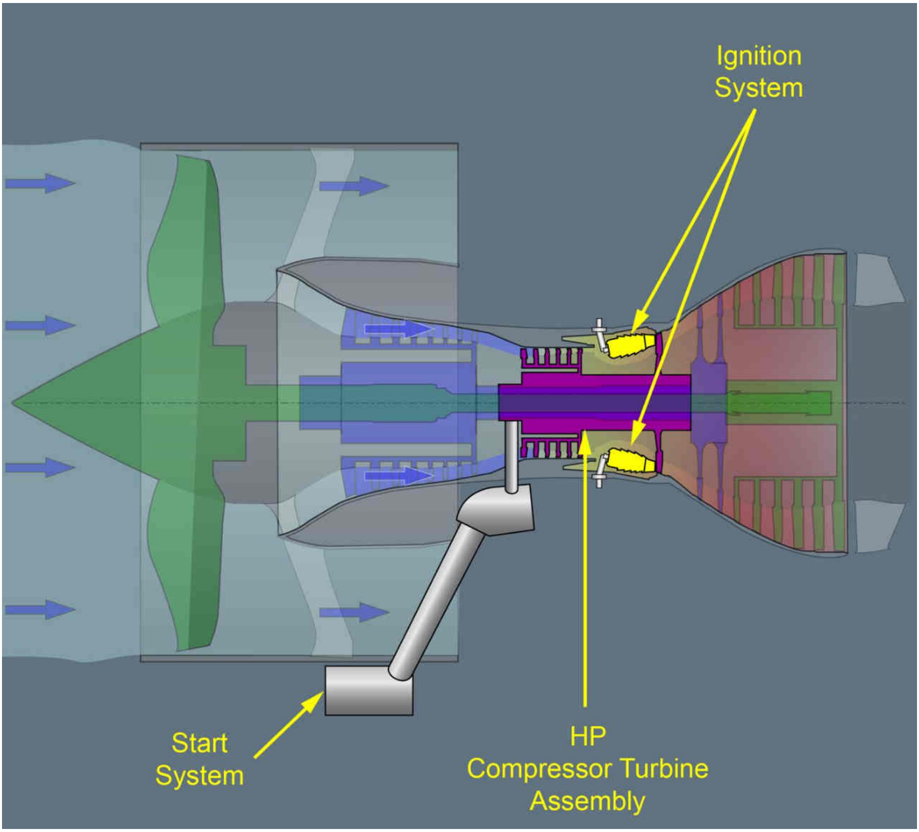
On ground, the ignition and the start systems:
- Start the engine
- Crank the engine.

In flight, the ignition and the start systems start the engine.

L2 The ignition and the start systems perform the following procedures in the following sequence:
- The start system uses bleed air in order to operate the pneumatic starter
- The pneumatic starter operates the HP compressor turbine assembly via the accessory gearbox
- Then, the fuel system adds fuel in the combustion chamber for the ignition.

The FADEC controls and monitors the ignition and the start systems.

Ignition and Start Systems



Ignition System
Start System
HP Compressor Turbine Assembly

Ignition System

IGNITION SYSTEM

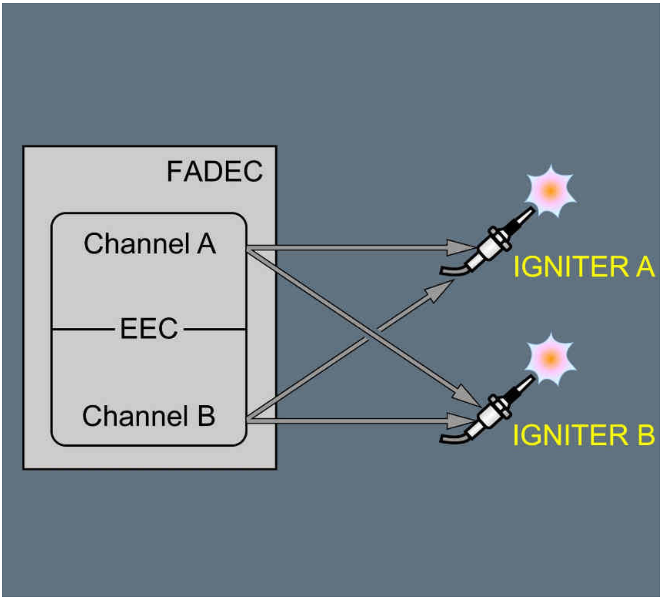
Ident.: DSC-70-10-80-20-00014515.0001001 / 23 APR 14
Applicable to: ALL

The ignition system ensures:
- Engine start on ground (automatic and manual engine starts)
- Engine relight in flight
- Flameout prevention.

In each engine, the ignition system has two independent igniters: Igniter A and igniter B.
The FADEC controls the ignition system.

L2 Each EEC channel can control both igniters.

Ignition System



IGNITION FOR ENGINE START

Ident.: DSC-70-10-80-20-00014516.0001001 / 13 JAN 15
Applicable to: ALL

ON GROUND

AUTOMATIC START

During an automatic start, the FADEC only uses one igniter.

L2 When the EGT is too high, the FADEC orders the engine to crank until the EGT goes below 150 °C.

L1 The EEC channel in control selects the ignition system to be used at each engine start and alternates it at least every 2 flights to avoid dormant failure.

L2 When the flight crew sets the ENG MASTER lever to ON, 2 s after N3 reaches 25 % and N2 reaches 5 %, the FADEC automatically selects the igniter.

L1 If an automatic start attempt is not successful, the FADEC uses both igniters during the second attempt.

L2 *Note:* *The FADEC automatically stops the ignition at the end of the start sequence, when N3 reaches approximately 50 %.*

L1 MANUAL START

During a manual start, the FADEC uses both igniters when the flight crew sets the ENG MASTER lever to ON.

L2 *Note:* *The FADEC automatically stops the ignition at the end of the start sequence, when N3 reaches approximately 50 %.*

L1 IN FLIGHT

In flight, the FADEC uses both igniters.

CONTINUOUS IGNITION

Ident.: DSC-70-10-80-20-00014517.0001001 / 03 JUL 20
Applicable to: ALL

FLAMEOUT PREVENTION

If the FADEC detects a possibility of flameout in the engine, the FADEC automatically selects both igniters in order to rapidly recover the engine.
The ignition ends 10 s after engine relight.

1 QUICK RELIGHT

The FADEC automatically selects continuous ignition with both igniters in the case of inadvertent cycling of the ENG MASTER lever with engine running.

Refer to DSC-70-10-80-20 Windmilling Quick Relight Function for Quick Relight function.

WINDMILLING QUICK RELIGHT FUNCTION

2 Ident.: DSC-70-10-80-20-00025507.0001001 / 03 JUL 20
Applicable to: ALL

In case of inadvertent engine shutdown by cycling the Engine Master lever to OFF then ON, the FADEC will attempt automatically a relight regardless of the rotary selector position.

To initiate a quick relight, the flight crew must set:
- The ENG START selector to NORM, and
- The ENG MASTER lever to ON then set it to OFF, and back to ON within 40 s.

L2 The quick relight is available if N3 is above 10 % in flight.
The FADEC automatically selects continuous ignition with both igniters during a quick relight.
L1 The ignition ends 10 s after engine relight.

Intentionally left blank

Start System

START SYSTEM

Ident.: DSC-70-10-80-30-00014518.0001001 / 23 APR 14
Applicable to: ALL

The start system uses pressurized air to:
- Start the engine on ground
- Relight the engine in flight.

The start system has:
- A pneumatic starter

L2 The pneumatic starter operates the HP compressor turbine assembly.

L3 The pneumatic starter is connected to the accessory gearbox.

L1
- An engine start valve.

The FADEC controls the engine start valve, depending on the position of the ENG MASTER lever.

L2 The maintenance personnel can manually open and close the engine start valve on ground.

Associated with the following ECAM alerts:
- ENG 1(2) START VLV NOT CLOSED (*Refer to procedure*), or
- ENG 1(2) START VLV NOT OPEN (*Refer to procedure*).

L1 The pneumatic starter starts the engine with the air of one of the following sources:
- The APU, or
- The other engine in operation (cross engine start), or
- The HP ground sources.

The engine starts either automatically or manually. To manually start the engine, the flight crew must set the ENG MAN START pb-sw to ON.

AUTOMATIC START

Applicable to: ALL

Ident.: DSC-70-10-80-30-10-00014519.0001001 / 23 APR 14

In the automatic start sequence, the FADEC controls the following systems in order to manage the engine start:
- The engine start valve
- The igniter(s)
- The Fuel Metering Valve (FMV)
- The HP shutoff valve of the fuel system.

L2 For more information about the automatic start sequence, *Refer to DSC-70-30 Sequence of the Automatic Start*.

Ident.: DSC-70-10-80-30-10-00014522.0001001 / 23 APR 14

START ABORT DURING AUTOMATIC START

As per associated ECAM procedure, the FADEC automatically stops the engine start if one of the following cases occurs:

- Hung start

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT LOW N1 (*Refer to procedure*).

L1
- No light up

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [NO LIGHT UP] (*Refer to procedure*).

L1
- Hot start or EGT exceeds the limit

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [EGT OVERLIMIT] (*Refer to procedure*).

L1
- Engine stall

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [ENG STALL] (*Refer to procedure*).

L1
- LP rotor jammed

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT LOW N1 (*Refer to procedure*).

L1
- Abnormal position of the engine start valve

L2 Associated with the following ECAM alerts:
  - ENG 1(2) START VLV NOT CLOSED (*Refer to procedure*), or
  - ENG 1(2) START VLV NOT OPEN (*Refer to procedure*).

L1
- Activation time of the pneumatic starter exceeded

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [STARTER TIME EXCEEDED] (*Refer to procedure*).

L1
- No sufficient bleed pressure to start the engine.

L2 Associated with the following ECAM alert: ENG 1(2) START VLV NO AIR PRESSURE (*Refer to procedure*).

For more information about start abort during automatic start, *Refer to DSC-70-40 Start Abort During Automatic Start*.

Ident.: DSC-70-10-80-30-10-00014524.0001001 / 23 APR 14

STARTER ASSISTED OR WINDMILLING START

In flight, if the flight crew sets the ENG MASTER lever to ON after an engine shutdown, the FADEC starts the engine via:
- The assistance of the pneumatic starter, or
- Windmilling.

In the case of a starter assisted start, the engine in operation or the APU provides the bleed air to the pneumatic starter.

L2 The FADEC starts the engine via a starter assisted start (i.e. the FADEC automatically opens the engine start valve) if:
- N3 is below 6 %, or
- The airspeed is below 250 kt.

L1 In the case of a windmilling engine start, the engine uses the relative wind for its own rotation.
L2 The FADEC disconnects both associated engine-driven hydraulic pumps in order to increase the relight envelope.

MANUAL START

Applicable to: ALL

Ident.: DSC-70-10-80-30-20-00014520.0001001 / 30 JUL 15

If an automatic start is not successful, the flight crew can perform a manual start.
In the manual start sequence, the FADEC has limited control. As a result, the flight crew must monitor engine acceleration.

To perform a manual start, the flight crew must:
- Set the ENG START selector to IGN/START
- Set the ENG MAN START pb-sw to ON
- Set the ENG MASTER lever to ON.

L2 The FADEC:
- Opens the engine start valve when the flight crew:
  - Sets the ENG START selector to IGN/START
  - Sets the ENG MAN START pb-sw to ON

  Note: *The engine start valve opens only if N3 is below 30 % in flight.*
- Opens the HP shutoff valve, and operates both igniters when the flight crew sets the ENG MASTER lever to ON
- Closes the engine start valve, and cuts off the ignition when N3 reaches 48 %.

For more information about the manual start sequence, *Refer to PRO-NOR-SUP-SUP-ENG Manual Engine Start*.

L1 The FADEC does not abort an abnormal manual start, except if the starter is engaged above the maximum engagement speed.

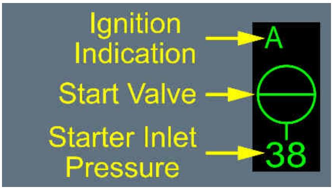
STARTING SEQUENCE INDICATION

During the engine start sequence, the start indications appear on the ENG SD page.

Start Parameters



IGNITION INDICATION

	The igniter A is used for the engine start sequence.
	Both igniters A and B are used for the engine start sequence or continuous ignition.

START VALVE

	The engine start valve is fully closed.
	The engine start valve is fully open.

L12

	The engine start valve failed in the closed position. Associated with the ENG 1(2) START VLV NOT OPEN (*Refer to procedure*).

L12

	The engine start valve failed in the open position. Associated with the following ECAM alert: ENG 1(2) START VLV NOT CLOSED (*Refer to procedure*).

STARTER INLET PRESSURE

38	The starter inlet pressure is normal.
61	The starter inlet pressure is: - Abnormally high - Above the engine start valve overpressure (60 PSI).
0	The starter inlet pressure is: - Abnormally low - Below 15 PSI, when N3 is above 8 %.

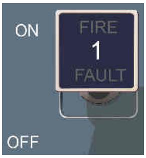
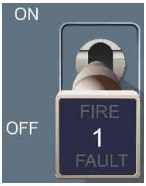
ENG 1(2) MASTER LEVER

L123



The FADEC:
- Provides the associated engine with continuous ignition, when both engines are running and the ENG START selector is set to IGN/START, or
- Initiates the wet crank process of the associated engine for maintenance purpose, when the ENG START selector is set to CRANK and the ENG MAN START pb-sw is set to ON, or
- Initiates the automatic start sequence of the associated engine, when the ENG START selector is set to IGN/START, or
  For more information, *Refer to DSC-70-10-80-30 Automatic Start*.
- Initiates the manual start sequence of the associated engine, when the ENG START selector is set to IGN/START and the ENG MAN START pb-sw is set to ON.
  For more information, *Refer to DSC-70-10-80-30 Manual Start*.



The FADEC:
- Shuts down the associated engine, or
- Aborts the start sequence of the associated engine.

Ident.: DSC-70-20-30-00015600.0001001 / 01 JUL 14

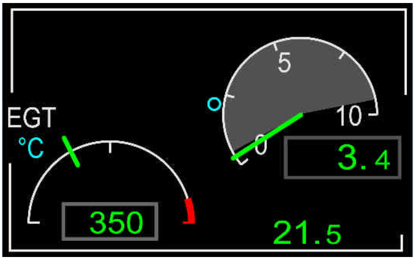
ATTENTION GETTING BOX

The attention getting box appears:
- In amber, or
- In white.

The attention getting box also appears on the ENG SD page.

L12

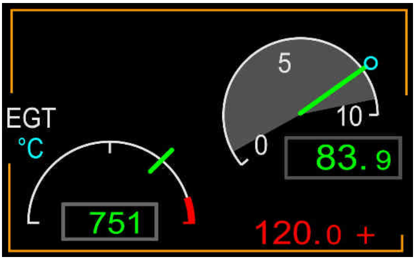


The flight crew must monitor the parameters of the corresponding engine.

The attention getting box:

- Appears during the engine start sequence, or the crank process
- Disappears as soon as the AVAIL indication appears on the ED.

L12



The flight crew must pay high attention to the parameters of the affected engine.

Appears if:

- The associated engine is failed, or
- N1 exceeds the red limit, or
- The EGT exceeds the EGT limit, or
- The thrust reversers are unlocked in flight.

Ident.: DSC-70-20-50-00015652.0001001 / 02 MAY 14

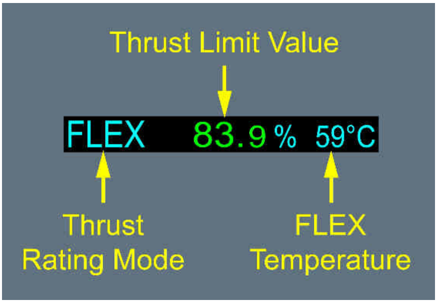
THRUST RATING MODE AND THRUST LIMIT VALUE

Indicates the thrust limit value and the associated thrust rating mode based on:

- The position of the thrust levers,
- Aircraft on ground or in flight,
- The engine status, i.e. running or not running,
- The data entered in the T.O and CLB panels of the FMS ACTIVE/PERF page.

Thrust Rating Mode and Thrust limit Value



THRUST RATING MODE

The thrust rating modes are:

- TOGA	Takeoff or go-around (TOGA) thrust rating mode is selected.
- MCT	Maximum Continuous Thrust (MCT) rating mode is selected.
- CLB	Climb (CLB) thrust rating mode is selected.
- FLEX	Flexible (FLEX) takeoff thrust rating mode is selected.
- DCLB	: Derated Climb thrust rating mode is selected.
- D04	Derated takeoff thrust rating mode is selected.
L12 - GA SOFT	Go-around soft (GA SOFT) thrust rating mode is selected. *Refer to DSC-22-FG-50-60 From Soft Go-around to Thrust reduction Altitude*.
- T.O+BUMP	Takeoff with bump thrust rating mode is selected.
- XX	There is no thrust rating mode selected or the selected rating mode is not available.
- N/A	The selected derated takeoff thrust rating mode is not available.

THRUST LIMIT VALUE

83.9 %	Indicates the thrust limit value associated with the thrust rating mode.

XX	Indicates that the thrust limit value is: - Not available, or - Below 0.1 %.

FLEX TEMPERATURE

59°C	Indicates the flexible temperature that the flight crew entered in the T.O panel of the FMS PERF page, when the FLEX rating mode is selected.

Ident.: DSC-70-20-50-00015684.0001001 / 23 APR 14

BLEED AIR CONFIGURATION

PACKS	The engine bleeds supply the air conditioning packs.
NAI	The engine nacelle anti-ice is on.
WAI	The wing anti-ice is on.

All indications can appear independently.

L2 The indication of the bleed air configuration disappears at the end of the takeoff.

Ident.: DSC-70-20-50-00015695.0001001 / 23 APR 14

IDLE INDICATION

L12

IDLE	Both engines are at idle speed, and the aircraft is in flight. Pulses during 10 s, and then remains steady.

Ident.: DSC-70-20-50-00015699.0001001 / 23 APR 14

AVAIL INDICATION

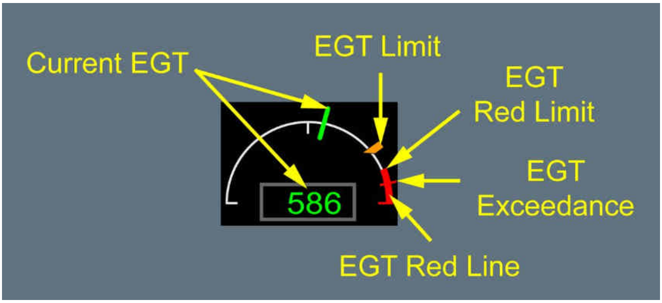
L12

AVAIL	The engine is started, and at or above idle. On ground, appears steady at least 10 s. In flight, pulses after a successful relight.

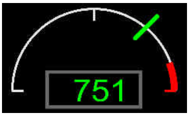
Ident.: DSC-70-20-50-00015711.0001001 / 23 APR 14

EGT INDICATOR

EGT Indicator

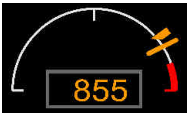


CURRENT EGT



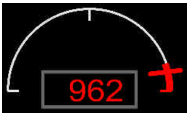
The current EGT is in normal range.

L13



The current EGT exceeds the EGT limit.
Associated with the following ECAM alert: ENG 1(2) EGT OVER LIMIT (*Refer to procedure*).

L123



The EGT is above the EGT red limit.

- During the takeoff, the current EGT:
  - Is between 900 °C and 920 °C for more than 20 s, or
  - Exceeds 920 °C
- During the other flight phases, the current EGT exceeds the EGT red limit.

Associated with the following ECAM alert: ENG 1(2) EGT OVER LIMIT (*Refer to procedure*).

EGT LIMIT

The amber line indicates the maximum EGT (i.e. the EGT limit).

L2 The maximum EGT is:
- 700 °C, during the engine start sequence on ground, or
- 850 °C, in all other cases.

The EGT limit does not appear:
- During takeoff, or
- When the thrust reversers are selected, or
- If the alpha floor protection is activated.

L1 **EGT EXCEEDANCE**

The EGT exceedance is the highest value that the EGT reached.

The EGT exceedance appears when:
- The current EGT exceeds the EGT red limit, or
- The EGT exceeded the EGT red limit.

L2 The red mark no longer appears at the next engine start sequence on ground.

L1 **EGT RED LINE**

The EGT red line appears between the EGT red limit and the end of the scale.

L2 The EGT red limit is 900 °C.

Ident.: DSC-70-20-50-00015710.0001001 / 05 NOV 15

71.0

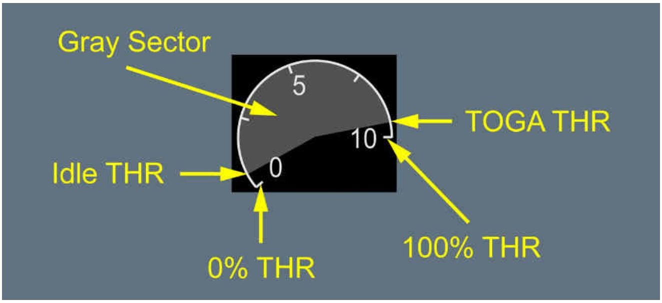
CURRENT THRUST

The needle and the digital value indicate the current thrust of the associated engine.

L2 The current thrust is a specific percent of the maximum thrust that the engine can provide with:
- The engine bleed off
- The thrust levers set to the TO/GA detent.

L1 THRUST GAUGE

Thrust Gauge



GRAY SECTOR

The gray sector indicates the usable thrust range.

L2 The gray sector appears when:
- The thrust levers are set to, or above, the idle (0) detent for more than 1 s
- The engine is not failed and is running
- The engine is in normal mode.

L1 IDLE THR

The lower position of the gray sector indicates the idle thrust.

L2 The idle thrust corresponds to the engine thrust when the associated thrust lever is set to the idle (0) detent.

L1 TOGA THR

The upper position of the gray sector indicates the TO GA thrust.

L2 The TOGA thrust corresponds to the engine thrust when the associated thrust lever is set to the TO/GA detent.
The TOGA thrust takes into account the bleed use.

L1 0 % THR

The 0 % THR is the engine thrust when:
- The associated engine is not running, or
- The windmilling starts.

100 % THR

The 100 % THR is the thrust that the engine can provide with:
- The associated thrust lever set to the TO/GA detent
- The engine bleed off.

TRANSIENT THRUST

The four green arcs indicate the difference between the thrust command and the current thrust, when the A/THR is active.

THRUST COMMAND

Indicates the thrust target, when the A/THR is active.

THRUST LEVER POSITION

The blue circle indicates:
- In manual mode, indicates the thrust after the engine stabilization
- In automatic mode, indicates the thrust that corresponds to the position of the associated thrust lever and the conditions of the flight.

L2 The thrust lever indication moves within the gray sector.

L1 THRUST TREND

The green triangle indicates the direction of the thrust trend, when the A/THR is active.

N1 INDICATION

93.8	N1 is in normal range.
L12 113.8 +	N1 exceeds the N1 red limit. For more information, *Refer to LIM-ENG Shaft Speeds*. The red cross will disappear at the next engine start on ground. Associated with the following ECAM alert: ENG 1(2) N1 OVER LIMIT (*Refer to procedure*).
L12 93.~~8~~	The accuracy of the N1 measurement is degraded. Associated with the following ECAM alerts: - ENG 1(2) CTL SYS FAULT (*Refer to procedure*), or - ENG 1(2) FADEC SYS FAULT (*Refer to procedure*).
XX	N1 indication is not available.

Ident.: DSC-70-20-50-00014926.0001001 / 24 JUN 14

REVERSE GRAY SECTOR

The gray sector indicates the usable reverse thrust gauge.

L2 The gray sector appears when:
- The thrust reversers are selected
- The thrust reversers are unlocked
- The thrust reverser lever is set to, or above, the reverse idle position for more than 1 s
- The engine is not failed and is running
- The engine master lever is set to ON
- The aircraft is on ground.

L1

REVERSE IDLE THRUST

The left position of the gray sector indicates the reverse idle thrust.
The reverse idle thrust corresponds to the engine thrust when the thrust reverser lever is set to the IDLE REV position.

MAXIMUM REVERSE THRUST

The right position of the gray sector indicates the maximum reverse thrust.
The maximum reverse thrust corresponds to the engine thrust when the thrust reverser lever is set to the MAX REV position.

REVERSE INDICATION

REV	The thrust reverser system is in deployment/stowage sequence.
REV	On ground, the thrust reverser system is fully deployed.

L12

REV	- On ground: • The reverse thrust is selected but not available, or • The thrust reverser system is unlocked - In flight, the REV indication pulses during 9 s and then remains steady, if the thrust reverser system is unlocked. Associated with the following ECAM alert: ENG 1(2) REVERSER UNLOCKED (*Refer to procedure*).

THRUST REVERSER LEVER POSITION

The blue circle indicates the position of the thrust reverser lever.

CURRENT REVERSE THRUST

The needle indicates the current reverse thrust of the engine, as a percentage of the maximum reverse thrust.

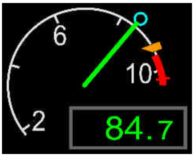
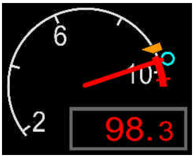
CURRENT N1 VALUE



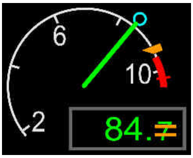
The current N1 is in normal range.

L12



The current N1 exceeds the N1 red limit.
For more information, *Refer to LIM-ENG Shaft Speeds*.
Associated with the following ECAM alert: ENG 1(2) N1 OVER LIMIT (*Refer to procedure*).

L12



The accuracy of the N1 measurement is degraded.

Associated with the following ECAM alerts:
- ENG 1(2) CTL SYS FAULT (*Refer to procedure*), or
- ENG 1(2) FADEC SYS FAULT (*Refer to procedure*).

N1 TREND

The green triangle indicates the direction of the N1 trend, when the A/THR mode is active.

N1 COMMAND

Indicates the N1 target, when the A/THR mode is active.

TRANSIENT N1

The four green arcs indicate the difference between the N1 command and the current N1, when the A/THR is active.

THRUST LEVER POSITION

The blue circle indicates the position of the thrust lever.
In manual mode, the blue circle corresponds to the N1 value reached after the stabilization of the engine parameters.

N1 LIMIT

The amber mark indicates the N1 limit.
L2 This corresponds to the maximum N1 value when the thrust levers are in TO/GA detent or in the MAX REV position.

L1 N1 EXCEEDANCE

The N1 exceedance is the highest value that the N1 reached.
The N1 exceedance appears when the current N1 exceeds the N1 red limit.
The N1 exceedance remains even if the N1 value decreases below the N1 red limit.
L2 The red mark no longer appears at the next engine start sequence on ground.

L1 N1 RED LINE

The N1 red line appears between the N1 red limit and the end of the scale.
L2 For more information, *Refer to LIM-ENG Shaft Speeds*.

THRUST LEVERS

The flight crew uses the thrust levers in order to:
- Adjust the thrust, or
- Select a thrust detent.

The flight crew can move each thrust lever individually.

L2 The position of the thrust levers appears on the ED, via a blue circle on the thrust gauge.

Ident.: DSC-70-20-40-00014922.0001001 / 23 APR 14

THRUST DETENTS

There are four detents:

- The Idle (0) detent
- The Climb (CL) detent
- The Maximum Continuous Thrust (MCT)/Flexible Take Off (FLX) detent
- The Takeoff (TO)/Go-Around (GA) detent.

Ident.: DSC-70-20-40-00014923.0001001 / 23 APR 14

THRUST REVERSER LEVERS

The flight crew uses the thrust reverser levers in order to:

- Control the deployment and the stowage of the associated reversers
- Adjust the associated reverse thrust.

The flight crew can move each thrust reverser lever from the IDLE REV position to the MAX REV position, when the associated thrust lever is set to the Idle (0) detent.

L2 The position of the thrust reverser levers appears on the ED, via a blue circle on the reverse thrust gauge.

Ident.: DSC-70-20-40-00014925.0001001 / 03 AUG 16

A/THR INSTINCTIVE DISCONNECT PB

Pressing the A/THR instinctive disconnect pb disconnects the A/THR (in flight) and the autobrake (on ground).

L2 For more information about the A/THR instinctive disconnect pb, *Refer to DSC-22-FG-90-70 Thrust Levers*.

For more information about the A/THR disconnection, *Refer to DSC-22-FG-50-40 A/THR Disconnection*.

of the
Engine Start

Sequence of the Automatic Start

Ident.: DSC-70-30-10-00014975.0001001 / 23 APR 14

INITIAL CONFIGURATION OF THE CONTROLS

The initial configuration of the ENG MASTER lever, the ENG START selector, and the ENG MAN START pb-sw is as follows:

- The ENG MASTER lever is set to OFF
- The ENG START selector is set to NORM
- The ENG MAN START pb-sw is set to OFF.

Ident.: DSC-70-30-10-00014978.0001001 / 23 APR 14

FIRST STEP

The flight crew must set the ENG START selector to IGN/START. As a result:

- The ENG SD page appears on the SD
- All engine parameters are available
- All pack valves automatically close.
  After 30 s, if the flight crew does not set the ENG MASTER lever to ON (*Refer to second step*), the pack valves automatically open again.

Ident.: DSC-70-30-10-00014979.0001001 / 25 JUN 14

SECOND STEP

The flight crew must set the ENG MASTER lever to ON.

ON GROUND

When the flight crew sets the ENG MASTER lever to ON:

- The LP fuel shutoff valve opens
- The FADEC opens the engine start valve
- The FADEC closes the pack valves if formally open.

When N3 reaches 25 %, and N2 reaches 8 % with EGT<150 °C, the FADEC:

- Supplies one ignitor
- Opens the HP fuel shutoff valve.

When N3 reaches 48 %, the FADEC:

- Closes the engine start valve
- Stop to energize the ignitor.

The automatic start sequence finishes, and the engine is at idle speed:

- **AVAIL** indication appears for few seconds on the engine display
- If there is no other engine start within 30 s, the pack valves automatically open.

IN FLIGHT

When the flight crew sets the ENG MASTER lever to ON:
- The LP fuel shutoff valve opens
- Depending on N3 or the airspeed, the FADEC:
  - Opens the engine start valve in order to start the engine, if N3 is below 6 % or the airspeed is below 250 kt, or
  - Starts the engine via a windmilling engine start.

The FADEC:
- Supplies one ignitor
- Opens the HP fuel shutoff valve.

When N3 reaches 48 %, the FADEC:
- Closes the engine start valve, if the FADEC previously opened it
- Stop to energize the ignitor.

The automatic start sequence finishes, and the engine is at idle speed:
- **AVAIL** indication appears for few seconds on the engine display
- If there is no other engine start within 30 s, the pack valves automatically open.

Ident.: DSC-70-30-10-00014982.0001001 / 23 APR 14

THIRD STEP

The automatic engine start is finished.

On ground:
- The WHEEL SD page replaces the ENG SD page
- The flight crew must set the ENG START selector to NORM.

In flight:
- The CRUISE SD page replaces the ENG SD page
- The flight crew must set the ENG START selector to NORM.

Ident.: DSC-70-30-10-00014983.0001001 / 23 APR 14

INTERRUPTION OF THE AUTOMATIC START

When required by ECAM and after confirmation, the flight crew must set the ENG MASTER lever to OFF.

If the flight crew sets the ENG MASTER lever to OFF, the FADEC automatically:
- Closes the engine start valve
- Closes the LP and the HP fuel shutoff valves
- Stop to energize the ignitor.

ENGINE SHUTDOWN

Ident.: DSC-70-30-00015060.0001001 / 23 APR 14
Applicable to: ALL

In order to shut down an engine, the flight crew must:
- Set the corresponding thrust lever to idle (0)
- Set the ENG MASTER lever to OFF, when the engine parameters are fixed at the correct value (i.e. the value that corresponds to the idle thrust).
  The FADEC automatically closes the LP and the HP fuel shutoff valves.

As a result, the engine decelerates and stops.

START ABORT DURING AUTOMATIC START

Ident.: DSC-70-40-00015374.0001001 / 09 MAR 16
Applicable to: ALL

As per associated ECAM procedure, the engine start must be stopped if one of the following cases occurs:

- Hung start

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [ENG STALL] (*Refer to procedure*).

L1 - No light up

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [NO LIGHT UP] (*Refer to procedure*).

L1 - Hot start or EGT exceeds the limit

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [EGT OVERLIMIT] (*Refer to procedure*).

L1 - Engine stall

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [ENG STALL] (*Refer to procedure*).

L1 - LP rotor jammed

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT LOW N1 (*Refer to procedure*).

L1 - Abnormal position of the engine start valve

L2 Associated with the following ECAM alerts:
- ENG 1(2) START VLV NOT CLOSED (*Refer to procedure*), or
- ENG 1(2) START VLV NOT OPEN (*Refer to procedure*).

L1 - Activation time of the pneumatic starter exceeded

L2 Associated with the following ECAM alert: ENG 1(2) START FAULT [STARTER TIME EXCEEDED] (*Refer to procedure*).

L1 - No sufficient bleed pressure to start the engine.

L2 Associated with the following ECAM alert: ENG 1(2) START VLV NO AIR PRESSURE (*Refer to procedure*).

L1 There are three types of aborted start during an automatic start:
- The automatic start on ground is automatically stopped (See below)
- The automatic start in flight is manually stopped (See below)
- The automatic start is manually stopped (See below).

AUTOMATIC START ON GROUND AUTOMATICALLY STOPPED

If one of the above-listed cases occurs on ground (See Start Abort During Automatic Start), the FADEC automatically stops the automatic start.

L2 The FADEC automatically:

- Closes the engine start valve
- Closes the HP fuel shutoff valve and the fuel metering valve
- Stops the ignition.

L1 The FADEC initiates a second and last automatic start sequence after the crank process, except if the LP rotor is jammed.

AUTOMATIC START IN FLIGHT AUTOMATICALLY STOPPED

In flight, automatic start is not aborted, However the FADEC monitors the engine parameters, and, as necessary, the ECAM triggers the associated alerts.
According to the ECAM alerts, the flight crew must initiate the associated corrective actions.

AUTOMATIC START MANUALLY STOPPED

The flight crew can interrupt an automatic start sequence and must set the ENG MASTER lever to OFF.

L2 If the flight crew sets the ENG MASTER lever to OFF:

- The LP and HP fuel shutoff valves close
- The engine start valve closes
- The ignition stops.

Criteria: XW

Applicable to: ALL

Impacted DU: NONE

Reason for issue:

This temporary documentary unit is issued to cover the risk of incorrect FMS predictions of:
- *The climb temperature profile*
- *The cruise temperature at top of climb.*

This can lead to unexpected fluctuations and low value of the REC MAX FL computed by FMS until top of climb. Once the aircraft is in cruise, this misbehavior no longer exists.

This can occur when one or both of the following occurs:
- *In the case of hot weather conditions on ground or during initial climb (i.e. the measured DISA is at least above +15 °C): if the flight crew has not manually entered a CRZ TEMP, the FMS incorrectly predicts a higher cruise temperature instead of the default FMS value of the INIT page.*
- *On ground, after a TROPO entry, the FMS automatically changes the pilot-entered CRZ TEMP value.*

As a result, to prevent such FMS misbehavior, the flight crew should:
- *Manually enter the CRZ TEMP (even the default value if deemed as applicable for the day-conditions)*
- *Keep the default value (i.e. 36 098 ft) of the TROPO value for the climb.*

M [(1)]	Localization	DU Title	DU identification	DU date
	Reason for issue: *This temporary documentary unit is issued to prevent the triggering of the ENG 1(2) STATOR A-ICE VLV CLOSED alert. This ECAM alert results in engine shut down and a "No Dispatch" situation. This ECAM alert is due to a variation in engine speed that is induced by any increase in thrust demand just after the engine start. This alert may interrupt the Engine Section Stator (ESS) anti-ice valve test.* *As a result, the flight crew must keep the engine thrust levers to IDLE for at least 30 seconds after AVAIL indication is displayed on the Engine Display (ED).*			

	PRO-NOR-SOP-110	**Before Takeoff**	PG00646	
	PRO-NOR-SOP-110	**Before Takeoff - PARK BRK**	00024407.0001001	27 OCT 17
	Criteria: XW **Applicable to: ALL** *Impacted DU: NONE*			
	Reason for issue: *This Temporary Documentary Unit is issued to provide the flight crew with a procedure to prevent any potential low level of residual braking during takeoff roll after parking brake release.*			

R	PRO-NOR-SOP-160	**Descent Preparation**	PG00651	
N	PRO-NOR-SOP-160	**Descent Preparation - ROW/ROP**	00025495.0001001	28 MAY 20
	Criteria: XW **Applicable to: ALL** *Impacted DU: 00018776 Descent Preparation - ROW/ROP*			
	Reason for issue: *When a pilot enters a runway shift on the ANF, the offside ANF is not fully synchronized.* *The effects of this erroneous synchronization are as follows:* - *An erroneous display of BTV data (ROW lines, blue arrow, and BTV path) on the offside ANF* - *In addition, if the offside ANF is the CM2 ANF (master ANF for PRIM and BTV):* • *A possible spurious ROW/ROP alert below the transition altitude* • *A possible strong deceleration rate during rollout in BTV mode.* *As a result, the tasksharing changes to enable CM2 to enter the runway shift, if required. This avoids a possible spurious ROW/ROP alert and a strong deceleration rate in BTV mode.* *A future standard of the ANF will remove this temporary documentary unit.*			
N	PRO-NOR-SOP-160	**Descent Preparation - Autobrake**	00025496.0001001	28 MAY 20
	Criteria: XW **Applicable to: ALL** *Impacted DU: 00006639 Descent Preparation - Autobrake*			

Continued on the following page

Continued from the previous page

M (1)	Localization	DU Title	DU identification	DU date
	Reason for issue: *This temporary documentary unit modifies the tasksharing when a runway shift is entered during ROW/ROP preparation. After CM2 (right side) enters the runway shift, CM2 continues with BTV preparation and arming (if BTV is used). This ensures a continuous flow and avoids a possible spurious ROW/ROP alert and a strong deceleration rate in BTV mode.* *If a runway shift is not entered, the tasksharing does not change.* *A future standard of the ANF will remove this temporary documentary unit.*			
N	PRO-NOR-TSK	**Descent Preparation**	00025497.0001001	28 MAY 20
	Criteria: XW **Applicable to: ALL** *Impacted DU: 00018759 Descent Preparation*			
	Reason for issue: *This temporary documentary unit modifies the tasksharing when a runway shift is entered. This avoids a possible spurious ROW/ROP alert and a strong deceleration rate in BTV mode.* *The tasksharing is therefore modified as follows:* *- CM2 (right side) enters the runway shift, if required* *- If BTV is used, CM2 continues with BTV preparation and arming.* *If a runway shift is not entered, the tasksharing does not change.* *A future standard of the ANF will remove this temporary documentary unit.*			
	PRO-NOR-SUP-SUP-ENG	**Crossbleed Engine Start**	PG02394	
	PRO-NOR-SUP-SUP-ENG	**Crossbleed Engine Start - After Start**	00024193.0001001	05 MAR 20
	Criteria: XW **Applicable to: ALL** *Impacted DU: 00006912 Crossbleed Engine Start - After Start*			
	Reason for issue: *This temporary documentary unit is issued to cover the triggering of the ENG 1(2) STATOR A-ICE VLV CLOSED alert leading to engine shut down and a "No Dispatch" situation. This alert is due to engine speed variation induced by any thrust demand increase just after the engine start, and may interrupt the Engine Section Stator (ESS) anti-ice valve test. As a result, the flight crew must keep the engine thrust lever to IDLE for at least 30 seconds after AVAIL indication is displayed on the Engine Display (ED) and also delay engine bleed setting.*

Applicable to: ALL

Abnormal and Emergency procedures involve actions that the flight crew must perform in order to ensure adequate safety, and help to make the remainder of the flight easier.

L2 For more information about the management of abnormal operations, *Refer to FCTM/AOP-30-10 General*.

Sub-Sections of Abnormal and Emergency Procedures

L1 [ABN] ECAM NOT-SENSED PROCEDURES

The [ABN] ECAM NOT-SENSED PROCEDURES menu provides direct access to the list of all abnormal and emergency ECAM not-sensed procedures published in the FCOM.

L2 For direct access to the [ABN] ECAM NOT-SENSED PROCEDURES menu, *Refer to PRO-ABN-ABN-ABN [ABN] EMERGENCY*.

L1 Abnormal and emergency not-sensed procedures are all the procedures that the flight crew can manually activate via the ECAM.

L2 For more information, *Refer to DSC-31-CDS-60-10-40 Abnormal Not-Sensed Procedures*.

L1 This [ABN] ECAM NOT-SENSED PROCEDURES menu in the FCOM is similar to the ABNORMAL NOT-SENSED PROCEDURES menu displayed on the WD via the ABN pb on the

ECP. However, for the sole purpose of the FCOM consultation, the title of each ABN not-sensed procedure listed in the FCOM menu starts with the prefix [ABN].
The abnormal not-sensed procedures are described in the applicable sub-sections of the abnormal and emergency procedures.

Note: *To consult the content of an abnormal not-sensed procedure, the flight crew must use the FCOM. The activation of the procedure via the ECAM Abnormal not-sensed menu is only dedicated to apply the procedure.*

[ADV] ECAM ADVISORY

The [ADV] ECAM ADVISORY section provides direct access to the list of all the advisories that can be displayed on applicable ECAM SD page.
L2 For direct access to the [ADV] ECAM ADVISORY section, *Refer to ECAM Advisory*.
L1 Advisories are system parameters that start to deviate from their usual operational range. However, an advisory does not require flight crew actions, except monitoring.
L2 For more information about the Advisory function, *Refer to DSC-31-CDS-60-10-40 Abnormal Not-Sensed Procedures*.

L1 [MEM] MEMORY ITEMS

The [MEM] MEMORY ITEMS menu provides direct access to the list of the memory items.
L2 For direct access to the menu, *Refer to [MEM] MEMORY ITEMS*.
L1 The content of the memory items are described in the applicable sub-sections of the abnormal and emergency procedures.
Memory items are procedures, or critical immediate actions of an ECAM/QRH/OEB procedure, that the flight crew must apply by memory to ensure a safe flight path. In some time-critical situations, the flight crew has no time to refer the ECAM and/or to the FCOM.
L2 For more information, *Refer to FCTM/AOP-10-40 Abnormal and Emergency Procedures*.

L1 [QRH] PROCEDURES

The [QRH] PROCEDURES menu provides direct access to the list of all the procedures that are in the QRH.
L2 For direct access to the menu, *Refer to [QRH] PROCEDURES*.
L1 The content of the QRH procedures are described in the applicable sub-sections of the abnormal and emergency procedures.

Note: *The QRH procedure in the FCOM manual is an electronic FCOM version of the associated procedure in the QRH manual. However, layer 2 or 3 information, if any, are only provided in the electronic FCOM manual, for FCOM consultation purpose.*

[RESET] SYSTEM RESET

The [RESET] SYSTEM RESET section provides direct access to the table listing all the system resets that are permitted, and the condition to apply them.

L2 For direct access to the table, *Refer to [RESET] SYSTEM RESET*.

L1 SUB-SECTIONS OF ABNORMAL AND EMERGENCY PROCEDURES

This part of the FCOM describes the detailed content of all abnormal and emergency procedures.
All procedures are grouped in sub-sections that can be system related (e.g. AIR, FUEL, etc.) or non-system related (e.g. MISC, T.O, TAIL STRIKE, etc.)
The sub-sections are sorted by alphabetic order.

For each sub-section, procedures are listed in the following order:

1. The ECAM abnormal or emergency not-sensed procedures
   The title of these procedures starts with the [ABN] prefix
2. The memory items
   The title of the memory items starts with the [MEM] prefix
3. The abnormal or emergency procedures of the QRH
   The title of these procedures starts with the [QRH] prefix
4. The ECAM sensed procedures.

FCOM PROCEDURE LAYOUT

Applicable to: ALL

Ident.: PRO-ABN-ABN-00-100-00007087.0001001 / 07 NOV 16

The presentation of abnormal and emergency procedures is as far as possible, identical to the presentation on the ECAM.

L2 In particular, the combination of failures is generally not considered in the FCOM and the information actually displayed on the ECAM (e.g. LDG PERF AFFECTED) may differ depending on the other active failures, if any.

L1 However, the FCOM also provides additional operational information (comments).
The FCOM displays in uppercase letters the information that appears on the ECAM and uses the same color as the ECAM. All the additional comments appear in the FCOM in lowercase letters.

Procedure Description
Procedure and Status

Ident.: PRO-ABN-ABN-00-100-00007088.0001001 / 06 NOV 14

PROCEDURE TITLE

ECAM PROCEDURES

The title of an abnormal or emergency procedure, that appears on the ECAM, is:

- Red for a warning
- Amber for a caution
- On a black background

Note: The [ABN] prefix indicates that the procedure is an ECAM not-sensed procedure.

Examples :

ECAM Sensed Procedure Title

SMOKE L(R) AVNCS SMOKE

ECAM Not-Sensed Procedure Title

[ABN] FIRE SMOKE/FUMES

NON ECAM PROCEDURES

The title of an abnormal or emergency procedure, that does not appear on the ECAM, is:

- Red for a warning
- Amber for a caution
- On a grey background

Note:
- *The [MEM] prefix indicates that the procedure contains memory items*
- *The [QRH] prefix indicates that the procedure is a QRH procedure.*

Examples:

Non ECAM QRH Procedure Title

[QRH] FIRE SMOKE/FUMES

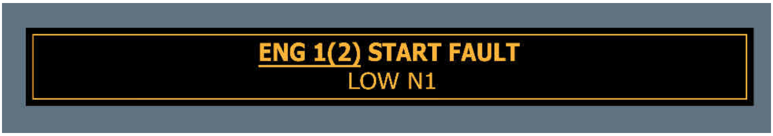
Non ECAM Memory Procedure Title

[MEM] TAWS CAUTION

SUBTITLE

When relevant, the procedure subtitle that appears on the ECAM is displayed below the procedure title.
Example:

Subtitle

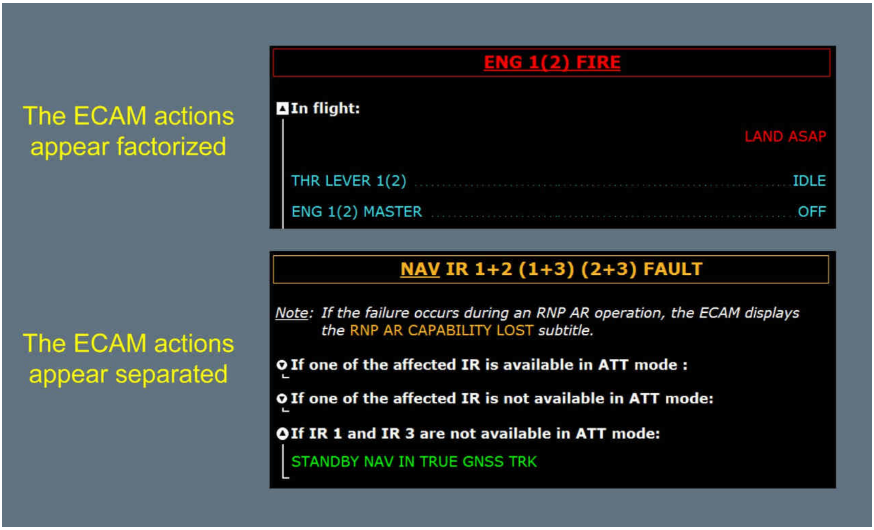


ENG 1(2) START FAULT
LOW N1

SEVERAL ALERTS UNDER THE SAME TITLE

When applicable, several alerts may be grouped under the same procedure title. However, depending on the failure, the actions that the flight crew should perform may differ.

Several Alerts Under the Same Title



The ECAM actions appear factorized

ENG 1(2) FIRE

In flight:

LAND ASAP

THR LEVER 1(2) .... IDLE

ENG 1(2) MASTER .... OFF

The ECAM actions appear separated

NAV IR 1+2 (1+3) (2+3) FAULT

Note: If the failure occurs during an RNP AR operation, the ECAM displays the RNP AR CAPABILITY LOST subtitle.

If one of the affected IR is available in ATT mode :

If one of the affected IR is not available in ATT mode:

If IR 1 and IR 3 are not available in ATT mode:

STANDBY NAV IN TRUE GNSS TRK

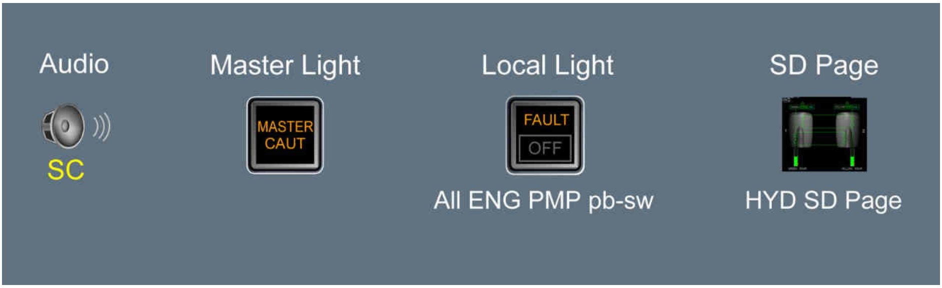
Ident.: PRO-ABN-ABN-00-100-00007089.0001001 / 06 NOV 14

ANNUNCIATIONS

When applicable, the annunciations section provides:

- The triggering conditions, that describe the cause of the alert activation
- The following indications associated with the alert:
  - Audio effect such as Single Chime (SC), or Continuous Repetitive Chime (CRC)
  - Master light (MASTER WARN or MASTER CAUT)
  - The local lights
  - The applicable SD page.

Indications



Audio
SC
Master Light
MASTER
CAUT
Local Light
FAULT
OFF
All ENG PMP pb-sw
SD Page
HYD SD Page

- The Flight phase inhibition .

FLIGHT PHASE INHIBITION

The Flight Phase Inhibition section indicates the flight phases during which the alert is inhibited. In the below example, the alert is inhibited in the aircraft flight phase 1, and 13.

L2 For more information, *Refer to DSC-31-CDS-60-10-10 ECAM Flight Phases*

PROCEDURE DESCRIPTION

When necessary, the Procedure Description section provides the purpose of the procedure or a summary of the procedure when the procedure is complex.

Ident.: PRO-ABN-ABN-00-100-00007091.0001001 / 07 NOV 16

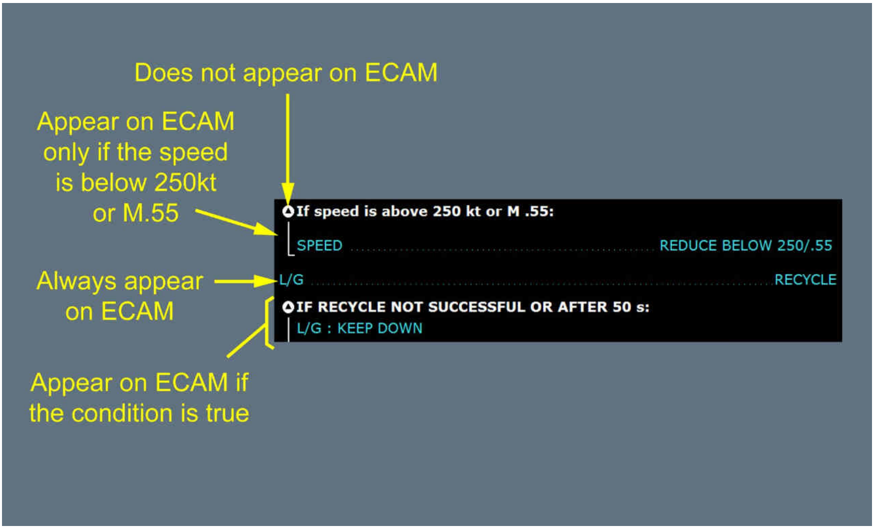
PROCEDURE AND STATUS

The Procedure and Status section provides the procedure and additional comments.

CONDITIONS

A white bullet appears in front of lines that are conditions. These lines are also referred to as condition lines. The content that is associated with a condition can be expanded or collapsed. The conditions that appear on the ECAM are in uppercase bold letters in the FCOM.
There are conditions, that are automatically managed by the ECAM, and do not appear on the ECAM, or that are part of non-ECAM procedures. Such conditions appear in the FCOM in lowercase letters.

Conditions

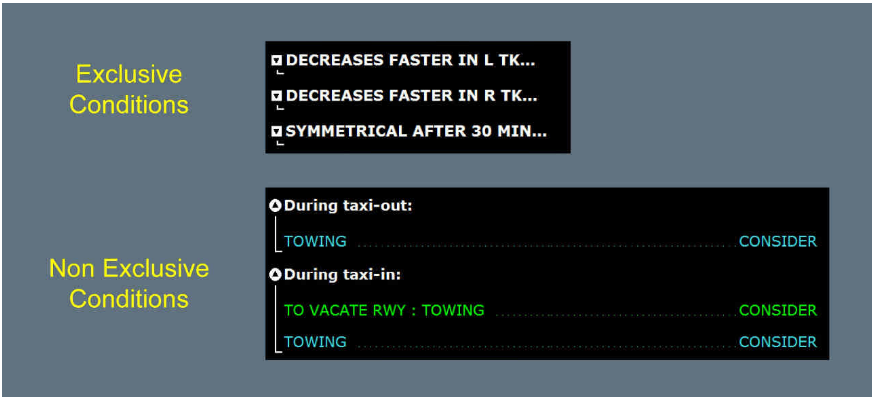


Does not appear on ECAM
Appear on ECAM only if the speed is below 250kt or M.55
Always appear on ECAM
Appear on ECAM if the condition is true

○ **If speed is above 250 kt or M .55:**
SPEED .... REDUCE BELOW 250/.55
L/G .... RECYCLE
○ **IF RECYCLE NOT SUCCESSFUL OR AFTER 50 s:**
L/G : KEEP DOWN

The conditions can be exclusive or not. Exclusive conditions are identified via a square bullet and non exclusive conditions are identified via a circle bullet.

Exclusive or Non Exclusive Conditions



☐ DECREASES FASTER IN L TK...

☐ DECREASES FASTER IN R TK...

☐ SYMMETRICAL AFTER 30 MIN...

○ During taxi-out:

TOWING .... CONSIDER

○ During taxi-in:

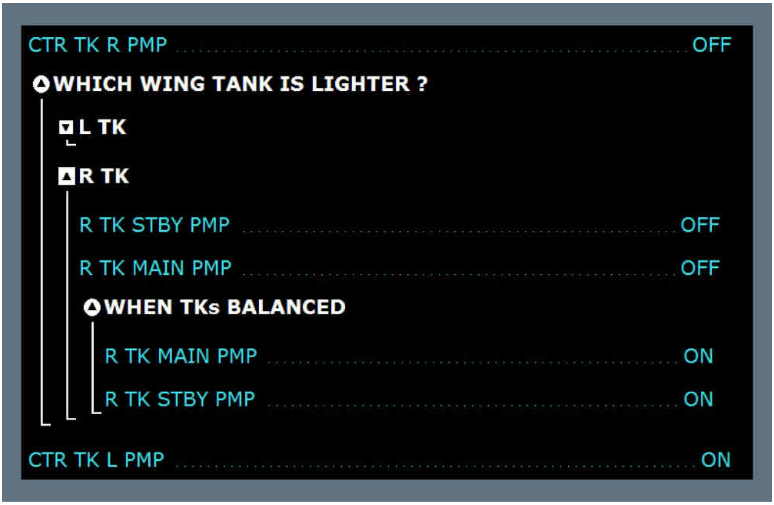
TO VACATE RWY : TOWING .... CONSIDER

TOWING .... CONSIDER

INDENTATION

When a procedure line depends on several conditions, these conditions are indented on the ECAM and in the FCOM.

Indentation



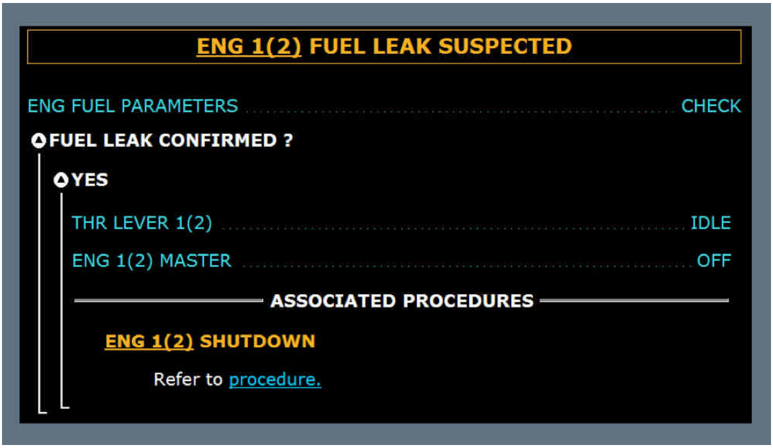
```
CTR TK R PMP ........................ OFF
○ WHICH WING TANK IS LIGHTER ?
  ☐ L TK
  ■ R TK
    R TK STBY PMP .................. OFF
    R TK MAIN PMP .................. OFF
    ○ WHEN TKs BALANCED
      R TK MAIN PMP ................ ON
      R TK STBY PMP ................ ON
CTR TK L PMP ........................ ON
```

ASSOCIATED PROCEDURES

Some alerts, also referred to as primary alerts, automatically trigger other associated alerts.

Associated alerts appear in the FCOM below the primary procedure.

Associated Procedures



ENG 1(2) FUEL LEAK SUSPECTED

ENG FUEL PARAMETERS .... CHECK

FUEL LEAK CONFIRMED ?

YES

THR LEVER 1(2) .... IDLE

ENG 1(2) MASTER .... OFF

ASSOCIATED PROCEDURES

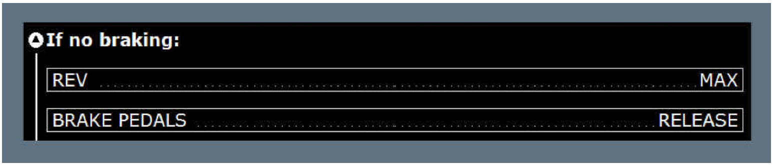
ENG 1(2) SHUTDOWN

Refer to procedure.

MEMORY ITEMS

Memory items are items that the flight crew must memorize, in order to be able to rapidly apply them, without referring to the ECAM, and/or to the FCOM.
Memory items are surrounded by a white box in the FCOM procedure, in order to enable the flight crew to easily identify them.

Memory Items



If no braking:

REV .... MAX

BRAKE PEDALS .... RELEASE

ALERTS IMPACTING LANDING PERF

The description of the abnormal procedure in the FCOM does not display the ALERTS IMPACTING LANDING PERF section of the STATUS page.

However, the flight crew can notice an abnormal procedure affects the landing distance computation with :
- The LDG DIST AFFECTED or LDG PERF AFFECTED action in the procedure description
- The LDG DIST AFFECTED or LDG PERF AFFECTED limitation in the LIMITATIONS ON ECAM part of the procedure description.

L2 For more information on the landing performance ECAM indications, *Refer to PER-LDG-50 Landing Performance following In-Flight Failure*.

STANDARD CALLOUTS FOR ABNORMAL OPERATIONS

Ident.: PRO-ABN-ABN-00-00021325.0001001 / 23 OCT 17
Applicable to: ALL

MEMORY ITEMS

The aim of the following callouts is to announce the appropriate procedure by calling out, in most cases, the title of the procedure. This allows the flight crew to be aware of the situation and be prepared to properly react (crew coordination, tasksharing, and communication).

EMERGENCY DESCENT

L2 For more information on the associated memory items, *Refer to PRO-ABN-MISC [MEM] EMER DESCENT*.

L1 ”EMERGENCY DESCENT”

LOSS OF BRAKING

L2 For more information on the associated memory items, *Refer to PRO-ABN-BRAKES [MEM] LOSS OF BRAKING*.

L1 ”LOSS OF BRAKING”

STALL INDICATIONS

L2 For more information on the associated memory items, *Refer to PRO-ABN-MISC [MEM] STALL RECOVERY*.

L1 "STALL, I HAVE CONTROL"

TAWS

- **If the flight crew considers an avoidance maneuver:**

  L2 For more information on the associated memory items, *Refer to PRO-ABN-SURV [MEM] TAWS WARNING*.

  L1 “PULL UP TOGA”

TCAS

L2 For more information on the associated memory items, *Refer to PRO-ABN-SURV [MEM] TCAS CAUTION - TRAFFIC ADVISORY* and *Refer to PRO-ABN-SURV [MEM] TCAS WARNING - RESOLUTION ADVISORY*.

L1
- **If a Traffic Advisory (TA) alert is triggered:**
  - **If AP/FD TCAS mode is armed:**

    "TCAS BLUE"

- **If AP/FD TCAS mode does not arm:**
  "TCAS, I HAVE CONTROL"

UNRELIABLE AIR SPEED INDICATIONS

L2 For more information on the associated memory items, *Refer to PRO-ABN-NAV [MEM] UNRELIABLE AIR SPEED INDICATION*.

L1 "UNRELIABLE SPEED"

WINDSHEAR WARNINGS

L2 For more information on the associated memory items, *Refer to PRO-ABN-SURV [MEM] WINDSHEAR WARNING - PREDICTIVE WINDSHEAR* and *Refer to PRO-ABN-SURV [MEM] WINDSHEAR WARNING - REACTIVE WINDSHEAR*.

L1 ”WINDSHEAR TOGA”

MALFUNCTION BEFORE V1 AT TAKEOFF

EVENT	CAPT	F/O
If GO decision	GO	
If RTO decision:	STOP	
- REV green on WD		REVERSE GREEN (1)
- Deceleration		DECEL (2)

(1) *If the reverse deployment is not as expected, call NO REVERSE ENGINE_ or NO REVERSE, as appropriate.*

(2) *In the case of failure or no positive deceleration: NO DECEL*
DECEL callout means that the deceleration is felt by the flight crew, and confirmed by the speed trend on the PFD. It can also be confirmed by the DECEL indication on the PFD, if the autobrake is active.
However, the DECEL indication appears when the current deceleration reaches 80 % of the selected deceleration rate. Therefore it is not an indication of the correct autobrake functioning, but it indicates that the deceleration rate is reached. E.g. the DECEL indication may not appear on a contaminated runway, with the autobrake active, due to the effect of the anti-skid.

COCKPIT/CABIN COMMUNICATION

For more information on the cabin/cockpit communication:
- *Refer to CCOM/14-30 Emergency Calls*
- *Refer to CCOM/14-30 Planned Emergency Landing*

EMERGENCY CALL

From	To	Communication Actions	Remark
Cockpit	Cabin	Passenger Address (PA) system: "CHIEF PURSER TO COCKPIT, PLEASE!"	The Chief Purser goes immediately to the cockpit to be briefed by the Captain. If time permits, the Captain should allow the Chief Purser to brief the cabin crew.
Cabin	Cockpit	Interphone: Press PRIO then CAPT	In the case of an abnormal or emergency situation in the cabin, any cabin crewmember must inform the flight crew. The flight crew must reply.

EMERGENCY ALERT

From	To	Communication Actions	Remark
Cockpit	Cabin	Passenger Address (PA) system: "ATTENTION CREW! AT STATIONS!"	The flight crew announces shortly and briefly that an emergency evacuation may be soon required. The cabin crew must proceed to their emergency stations and fasten their seat belts.

NOTIFICATION TO PASSENGERS

From	To	Communication Actions	Remark
Cockpit	Cabin	SIGNS set to ON. If duties permit, use the Passenger Address (PA) system	For psychological reason, the flight crew should inform the passengers of an intended emergency landing.

FINISH PREPARATION

From	To	Communication Actions	Remark
Cockpit	Cabin	Passenger Address (PA) system: "FINISH PREPARATION"	The flight crew announces that the preparation is finished a short time before the emergency landing.

BRACE FOR IMPACT

From	To	Communication Actions	Remark
Cockpit	Cabin	Passenger Address (PA) system: "BRACE FOR IMPACT"	The flight crew announces to brace for impact approximately 1 min before landing.

INITIATE EVACUATION

From	To	Communication Actions	Remark
Cockpit	Cabin	Press the EVAC COMMAND pb-sw . Passenger Address (PA) system: "EVACUATE, EVACUATE"	The Captain orders an immediate evacuation. The cabin crew directs passengers to all available emergency exits.

EVACUATION NOT REQUIRED

From	To	Communication Actions	Remark
Cockpit	Cabin	Passenger Address (PA) system: "CABIN CREW and PASSENGERS REMAIN SEATED"	If the Captain decides that an evacuation is not necessary, the flight crew immediately announces the decision.

[RESET] SYSTEM RESET TABLE

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-RESET-00006875.0001001 / 12 DEC 16
Applicable to: ALL

Some systems that operate abnormally can be recovered by a computer reset.

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

L2 The flight crew can perform a system reset with the use of the associated cockpit controls (e.g. pushbutton), or the reset button.

The below system reset table:
- Lists all the systems that the flight crew can reset
- Provides the conditions to perform the reset
- Describes the precautions to take and the potential effects of the reset.

L1 To perform a system reset, follow the here below actions, unless indicated differently in the applicable reset procedure:
- If the associated control is used: Set the associated control to OFF, wait three seconds, and set the associated control to ON.
- If the associated reset button is used: Pull the associated reset button, wait one second, and push the associated reset button.

Note: The flight crew should report any in-flight reset to the maintenance.

- L1 The ENG 1(2) MASTER levers are located on the ENG MASTER Panel.
  L2 For more info on the ENG MASTER Panel,*Refer to DSC-26-30-20 ENG MASTER Panel*.

Continued on the following page

AUTO FLT A/THR RESET (Cont'd)

Ident.: PRO-ABN-ABN-RESET-AUTO_FLT_0-00025037.0001001 / 08 JUL 19

PROCEDURE

On ground, before taxi only:

■ **If no engine running:**

A/THR....................PRESS

This enables to re-engage the A/THR. This cancels the ECAM alert.

A/THR INSTINCTIVE DISCONNECT....................PRESS

■ **If at least one engine is running:**

EXTERNAL OR APU GEN POWER....................APPLY

● **For running engine(s):**

ENG MASTER....................OFF

A/THR....................PRESS

This enables to re-engage the A/THR. This cancels the ECAM alert.

A/THR INSTINCTIVE DISCONNECT....................PRESS

BRAKES BRK PEDAL TRANSMITTER SWITCH RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-BRAKES-00024048.0001001 / 27 NOV 17

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table, *Refer to PRO-ABN-ABN-RESET BRAKES*.

The below reset procedure is applicable:
- On ground only, and
- When no other BRAKES related messages are displayed on the DISPATCH page than the BRAKES BRK PEDAL TRANSMITTER SWITCH.

LOCATION

The Braking Control System (BCS) reset buttons are on the overhead panel, on the RESET panel, at location:
- BSCS 1 [D3] (left panel)

PROCEDURE

INITIAL CONDITIONS

PARK BRK....................SET

L2 *The flight crew should set the parking brake to prevent aircraft movement during the reset procedure.*

L1 **TO CLEAR THE** BRAKES BRK PEDAL TRANSMITTER SWITCH **MESSAGE:**

BSCS 1....................PULL
BSCS 2....................PULL

L2 *This action results in the display of the BRAKES AUTO BRK FAULT alert on the WD and the BRAKES CTL 1+2 message on the DISPATCH page. These messages remain displayed until the BSCS 1 or BSCS 2 reset button is pushed again.*

L1 After 3 s:
BSCS 1....................PUSH
BSCS 2....................PUSH

TO CHECK THAT BOTH SIDES OF THE BRAKING CONTROL SYSTEM DO NOT DETECT THE FAILURE:

L2 The procedure below checks that the failure that led to the display of the BRAKES BRK PEDAL TRANSMITTER SWITCH message is not present anymore in the braking control system. The check is first done on BSCS side 1 and then on BSCS side 2.
If the message BRAKES BRK PEDAL TRANSMITTER SWITCH is displayed again during this procedure, this means that an actual failure is detected on the brake pedals transmitter unit. In this case, maintenance action is due.

L1 BSCS 2....................PULL
After 3 s:
BSCS 2....................PUSH

L2 *This reset of the side 2 of the braking control system permits to give control to the side 1.*

L1 BOTH BRAKE PEDALS....................FULLY PRESS AND RELEASE
DISPCH pb....................PRESS
BRAKES BRK PEDAL TRANSMITTER SWITCH MESSAGE....................CHECK NOT DISPLAYED

- **If** BRAKES BRK PEDAL TRANSMITTER SWITCH **message displayed:**
  RESET PROC....................ABORT

CAB COM CIDS RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-CAB_COM-00022436.0001001 / 12 DEC 16

WARNING	
	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table.*Refer to PRO-ABN-ABN-RESET [RESET] System Reset Table*
A complete CIDS reset will result in the loss of PA and interphone for 3 min.
When all CIDS reset buttons are pulled disregard CAB COM CIDS 1+2 FAULT alert.

Note: *If the flight crew keeps one CIDS reset button pulled, there is no impact on the aircraft dispatch, Refer to MMEL/MI-44-10 CIDS Director.*

LOCATION

The CIDS reset buttons are on the overhead panel, on the RESET panel, at location:

CAB COM CIDS RESET (Cont'd)

Ident.: PRO-ABN-ABN-RESET-CAB_COM-00022437.0001001 / 03 JAN 20

PROCEDURE

- **With no passengers on board (on ground only):**
  CIDS 2 RESET .... PULL
  - **After 5 s**
    CIDS 1 RESET .... PULL
  - **After 5 s**
    CIDS 1, 2 .... PUSH AT THE SAME TIME

    L2 This action results in:
    - A full bright cabin illumination
    - The loss of basic CIDS communications (e.g. PA, interphone) for 3 min
    - The loss of FAPs for 5 min.

    L1 CABIN CREW .... ADVISE

    L2 Inform the cabin crew that the cabin systems should be recovered in 5 min.

L1
- **With passengers on board (on ground or in flight):**
  - **If no CIDS under MMEL 44-10-01:**
    CIDS 1 RESET .... PULL
    CABIN CREW .... ADVISE

    L2 *Inform the cabin crew that the cabin systems should be recovered in 1 min.*

    L1
    - **After 1 min, if the cabin crew informs that the pull action on the CIDS 1 reset button is successful:**
      CIDS 1 RESET .... KEEP PULLED
    - **If the cabin crew informs that the pull action on the CIDS 1 reset button is not successful:**
      CIDS 1 RESET .... PUSH

      L2 *CIDS 1 restart.*

      If CIDS 1 becomes the active computer, the following occurs:
      - *CIDS 1 is in default settings (basic) mode.*
        In default settings (basic) mode the cabin is fully illuminated.
      - *The basic CIDS communications (e.g. PA, interphone) are lost for 30 s.*
      - *The FAPs are not available for 5 min.*

Continued on the following page

CAB COM CIDS RESET (Cont'd)

If the push action is successful, the cabin systems are recovered after 5 min.

L1 CABIN CREW..ADVISE

L2 Inform the cabin crew that the cabin systems should be recovered in 5 min.

L1
- **After 5 min, if the cabin crew informs that the push action on the CIDS 1 reset button is not successful:**

  Repeat the same actions on the CIDS 2 reset button.

- **If CIDS 1 under MMEL 44-10-01:**

  CABIN CREW..ADVISE

  L2 Inform the cabin crew that the cabin systems should be recovered in 5 min.

  L1 CIDS 2 RESET..PULL

  - **After 5 s**

    CIDS 2 RESET..PUSH

    L2 *CIDS 2 restart.*

    If CIDS 2 restarts while CIDS 1 is deactivated, the following occurs:
    - *CIDS 2 is in default settings (basic) mode.*
      In default settings (basic) mode the cabin is fully illuminated.
    - *The basic CIDS communications (e.g. PA, interphone) are lost for 30 s.*
    - *The FAPs are not available for 5 min.*

    If the push action is successful, the cabin systems are recovered after 5 min.

L1
- **If CIDS 2 under MMEL 44-10-01:**

  CABIN CREW..ADVISE

  L2 Inform the cabin crew that the cabin systems should be recovered in 5 min.

  L1 CIDS 1 RESET..PULL

  - **After 5 s**

    CIDS 1 RESET..PUSH

    L2 *CIDS 1 restart.*

    If CIDS 1 restarts while CIDS 2 is deactivated, the following occurs:
    - *CIDS 1 is in default settings (basic) mode.*
      In default settings (basic) mode the cabin is fully illuminated.
    - *The basic CIDS communications (e.g. PA, interphone) are lost for 30 s.*
    - *The FAPs are not available for 5 min.*

Continued on the following page

CAB COM CIDS RESET (Cont'd)

If the push action is successful, the cabin systems are recovered after 5 min.

CAB COM CABIN CONNECTIVITY ⩤ RESET

Applicable to: ET-ATQ, ET-ATR

Ident.: PRO-ABN-ABN-RESET-CAB_COM1-00023100.0002001 / 03 AUG 16

WARNING	1. The flight crew can attempt a system reset when: - The ECAM procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table, *Refer to PRO-ABN-ABN-RESET CAB COM*.

LOCATION

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET CAB PRESS*.

LOCATION

The CABIN ALT MODE pb-sw and the CABIN V/S MODE pb-sw are on the overhead panel, on the CABIN PRESS panel. *Refer to DSC-21-PRESS-20 CABIN PRESS Panel*.

LIMITATIONS / CONSEQUENCES

- On ground, flight crew must wait for 2 min in order to check that the CAB PRESS control mode reset is successful, and
- Only one reset attempt is permitted.

Continued on the following page

CAB PRESS CTL MODE RESET (Cont'd)

Ident.: PRO-ABN-ABN-RESET-CAB_PRESS-00023526.0001001 / 03 JAN 19

PROCEDURE

- **On ground:**
  CABIN ALT MODE (CABIN V/S MODE).. MAN

  The CAB PRESS control mode reset can be performed by use of either the CABIN ALT MODE pb-sw or the CABIN V/S MODE pb-sw.

  - **After 3 s:**
    CABIN ALT MODE (CABIN V/S MODE)..AUTO

    Flight crew must wait for 2 min in order to check that the CAB PRESS control mode reset is successful.

    - **After 2 min, if ECAM alert (or dispatch message, as applicable) still displayed:**
      CABIN ALT MODE (CABIN V/S MODE): DO NOT RESET

      Do not attempt a second CAB PRESS control mode reset.
      Consider the ECAM alert (or dispatch message, as applicable) as valid.

- **In flight:**
  CABIN ALT MODE (CABIN V/S MODE).. MAN

  Use either the CABIN ALT MODE pb-sw or the CABIN V/S MODE pb-sw to perform the CAB PRESS control mode reset.

  - **After 3 s:**
    CABIN ALT MODE (CABIN V/S MODE)..AUTO

    Do not attempt a second CAB PRESS control mode reset.

CDS HUD RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-CDS-00022536.0001001 / 12 DEC 16

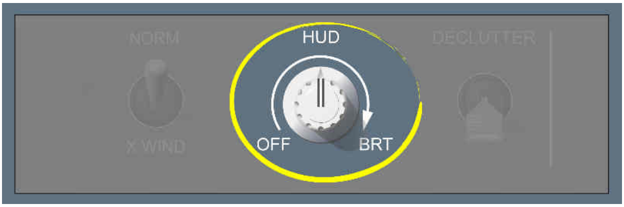
WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET CDS*.

LOCATION

Each HUD has its own HUD knob located on the HUD CP, in front of each flight crew. The HUD knob turns off or on, and adjusts the brightness of the associated HUD.

HUD knob



Ident.: PRO-ABN-ABN-RESET-CDS-00022537.0001001 / 22 JAN 15

PROCEDURE

HUD knob...OFF

- **After 5 s:**

  HUD knob...ON

- **If reset not successful:**

  HUD knob...OFF

  HUD...STOW

CDS CAPT(F/O) KCCU RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-CDS1-00025332.0001001 / 03 JAN 20

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET CDS*.
The below reset procedure is applicable on ground only.
A complete reset of CAPT(F/O) KCCU will result in the loss of CAPT(F/O) KCCU for 3 min.

LOCATION

Each KCCU has two power supply buttons on the overhead panel, on the CKPT EQPT POWER SUPPLY panels:

- At location [A6] for CCD 1 and [B6] for KBD 1 (left panel):

CDS CAPT(F/O) KCCU RESET (Cont'd)

Ident.: PRO-ABN-ABN-RESET-CDS1-00025333.0001001 / 03 JAN 20

PROCEDURE

After aircraft power-up, if the CAPT(F/O) KCCU is inoperative:

- **In the case of CAPT KCCU (CCD and/or KBD) inoperative:**

  CCD 1 .... PULL

  L2 When the CCD 1 power supply button is pulled, the associated CDS CAPT KCCU CURSOR CTL FAULT ECAM alert appears on the ECAM.

  - L1 **After 30 s:**

    KBD 1 .... PULL

    L2 When the KBD 1 power supply button is pulled, the CDS CAPT KCCU CURSOR CTL FAULT ECAM alert disappears.

    The CDS CAPT KCCU CURSOR CTL+KEYBOARD FAULT ECAM alert appears on the ECAM.

  - L1 **After 30 s:**

    KBD 1 .... PUSH

    L2 When the KBD 1 power supply button is pushed, the CDS CAPT KCCU CURSOR CTL +KEYBOARD FAULT ECAM alert disappears.

    The CDS CAPT KCCU CURSOR CTL FAULT ECAM alert appears on the ECAM.

  - L1 **After 30 s:**

    CCD 1 .... PUSH

    L2 When the CCD 1 power supply button is pushed, the CDS CAPT KCCU CURSOR CTL FAULT ECAM alert disappears.

- L1 **In the case of F/O KCCU (CCD and/or KBD) inoperative:**

  CCD 2 .... PULL

  L2 When the CCD 2 power supply button is pulled, the associated CDS F/O KCCU CURSOR CTL FAULT ECAM alert appears on the ECAM.

  - L1 **After 30 s:**

    KBD 2 .... PULL

    L2 When the KBD 2 power supply button is pulled, the CDS F/O KCCU CURSOR CTL FAULT ECAM alert disappears.

Continued on the following page

CDS CAPT(F/O) KCCU RESET (Cont'd)

The CDS F/O KCCU CURSOR CTL+KEYBOARD FAULT ECAM alert appears on the ECAM.

L1

- **After 30 s:**

  KBD 2 .... PUSH

L2

When the KBD 2 power supply button is pushed, the CDS F/O KCCU CURSOR CTL +KEYBOARD FAULT ECAM alert disappears.

The CDS F/O KCCU CURSOR CTL FAULT ECAM alert appears on the ECAM.

L1

- **After 30 s:**

  CCD 2 .... PUSH

L2

When the CCD 2 power supply button is pushed, the CDS F/O KCCU CURSOR CTL FAULT ECAM alert disappears.

COM ATC DATALINK RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-COM-00022250.0001001 / 12 DEC 16

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET COM*.
If the alert is due to an IMA module failure, do not reset the ATC datalink.

During the ATC datalink reset, several ECAM alerts may be temporarily displayed, e.g.:
- COM ATC DATALINK FAULT
- COM ADS-C DATALINK FAULT.

LOCATION

The ATC datalink reset button is on the overhead panel, on the RESET panel, at location [E4] (left panel):

FUEL FQMS 1(2) RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-FUEL-00021252.0001001 / 12 DEC 16

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET FUEL*.

If the alert is due to an IMA module failure, do not reset the FQMS.

During the FQMS reset, several ECAM alerts may be temporarily displayed, e.g.:
- FUEL FQMS 1 FAULT for FQMS 1 reset
- FUEL FQMS 2 FAULT for FQMS 2 reset.

Those temporary alerts have to be disregarded.

LOCATION

The FQMS reset buttons are on the overhead panel, on the RESET panel, at location:
- FQMS 1 [F2] (left panel):

NAV IR FAST ALIGNMENT

Applicable to: ALL

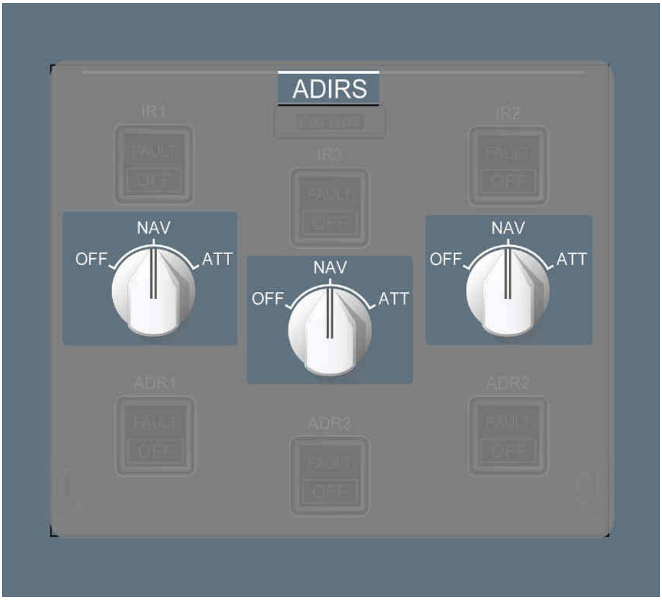
Ident.: PRO-ABN-ABN-RESET-NAV-00023759.0001001 / 27 NOV 17

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET NAV*.
On ground only, the IR fast alignment can reset the erroneous NAV RNP AR CAPABILITY LOST message on the ND and the erroneous NAV PRIMARY LOST message on the ND and MFD.

LOCATION

The access to the control of the IR 1(2)(3) is available on the ADIRS panel, on the overhead panel IR MODE selector



Continued on the following page

NAV IR FAST ALIGNMEMENT (Cont'd)

LMITATIONS

For alignment, the aircraft must be stopped. Any aircraft movement automatically restarts the alignment.

Note: The alignment during engines start or while engines are running is possible.

Ident.: PRO-ABN-ABN-RESET-NAV-00022252.0001001 / 06 NOV 14

PROCEDURE

- **On ground only:**
  IR 1(2)(3) MODE SEL.......................................OFF
  - **Within 4 s:**
    IR 1(2)(3) MODE SEL.......................................NAV
    L2 *A fast IR alignment is started (that lasts approximately 30 s).*
  - L1 **If reset not successful:**
    Consider the NAV RNP AR CAPABILITY LOST message on ND or the NAV PRIMARY LOST message on ND and MFD as valid.

OIS AVNCS RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-OIS_1-00021978.0001001 / 12 DEC 16

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET [RESET] System Reset Table*.
The reset duration is 7 min.

LOCATION

The OIS AVNCS reset button is on the overhead panel, on the RESET panel, at location [R4] (right panel):

OIS CAB&MAINT RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-OIS_2-00021980.0001001 / 03 JAN 20

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET [RESET] System Reset Table*.

The OIS CAB&MAINT reset results in the loss of the following applications:
- The EFB display on OIS for 3 min
- The cabin connectivity for passengers (i.e. internet ◁✳ and/or mobile telephony ◁✳ services) for 9 min
- The telemedicine ◁✳ for 9 min
- The CAB&MAINT and COMPANY COM applications for 9 min.

The complete reset duration is 12 min.

LOCATION

The OIS CAB&MAINT reset button is on the overhead panel, on the RESET panel, at location [S4] (right panel):

OIS CAB&MAINT RESET (Cont'd)

Ident.: PRO-ABN-ABN-RESET-OIS_2-00021981.0001001 / 03 JAN 20

PROCEDURE

- **If EFB applications are required during 3 min reset time:**
  EFB LAPTOP UNSTOW....................CONSIDER

OIS CAB&MAINT [S4]....................PULL
EXPECT EFB DISPLAY LOSS ON OIS (RESET 3 MIN)
EXPECT CABIN PAX CONNECTIVITY ◁ LOSS (RESET 9 MIN)
EXPECT TELEMEDICINE ◁ LOSS (RESET 9 MIN)
EXPECT COMPANY COM LOSS (RESET 9 MIN)

- **After 10 s:**
  OIS CAB&MAINT [S4]....................PUSH
  CABIN CREW....................ADVISE

L2 *Inform the cabin crew that the cabin systems should be recovered in less than 9 min.*

L1
- **On ground only (engines not running):**
  EFB (ALL SIMULTANEOUSLY)....................RESTART

L2 *Restart simultaneously all the EFBs, including the Spare EFB (EFB 3) ◁ .*

L1

The simultaneous EFB restart will enable to recover wireless data communication with the ground.

The EFB restart will require to re-initialize the flight data in the EFB including the selection of MEL/CDL items.

OIS LAPTOP DOCKING STATION RESET

Applicable to: ALL

Ident.: PRO-ABN-ABN-RESET-OIS_3-00021982.0001001 / 12 DEC 16

WARNING	1. The flight crew can attempt a system reset when: - The ECAM/OEB procedure requests to reset a system, or - The reset is permitted in the system reset table. 2. Only perform one reset at a time, unless indicated differently in the applicable reset procedure of the table.

For system reset table consultation, *Refer to PRO-ABN-ABN-RESET AUTO FLT*.
After the OIS CAB&MAINT reset, the EFB display is available after 3 min. The complete reset duration of the OIS CAB&MAINT server is 9 min.

LOCATION

The DOCK STATION pb is on the control panel of the laptop docking station:

LDS Power Supply Button Location

L2 On ground, if one PRSOV remains abnormally open after engine start, the flight crew must increase the N1 on the affected engine. This N1 increase creates enough power to close the affected PRSOV.
If the issue is solved, the alert disappears and the flight crew should set the thrust levers to IDLE and resume normal operations.

Continued on the following page

A-ICE ENG 1(2) VLV OPEN (Cont'd)

Ident.: PRO-ABN-A-ICE-3021W400-00007536.0003001 / 08 AUG 18

- **On ground:**
  GROUND CREW....................NOTIFY
  PARK BRK....................ON
  ENG 1(2)....................INCREASE N1 UP TO 35% MAX

L2 *Increasing the N1 should solve the issue. If the engine 1(2) A-ICE valve is correctly closed after the N1 increase, the issue is solved and the alert disappears. If the alert disappears, the flight crew should set the thrust levers to IDLE and resume normal operations.*

L1
  - **AFTER 30 s**
    THR LEVER 1(2)....................IDLE

Depending on the failure, the ECAM alert proposes appropriate actions to attempt a recovery of the wing anti-ice system if it is possible:

- If wing anti-ice is on, and provided that the engines are not at takeoff power, the flight crew can attempt an immediate recovery by applying the proposed ECAM actions, or
- The flight crew can activate the deferred procedure > WING A-ICE RECOVERY later on, as required.

Note: 1. *If the alert is only due to an IMA module failure, the ECAM displays the DUE TO IMA MODULE FAULT subtitle.*
2. *If the alert is due to the simultaneous activation of the wing anti-ice system and the APU bleed, the ECAM displays the WING A-ICE NOT AVAIL ON APU BLEED subtitle.*

ANNUNCIATIONS

Triggering Conditions:

L2 The alert is triggered in the case of:

- The failure of the control or monitoring of the wing anti-ice system, or
  L3 For more information, *Refer to DSC-30-20-10 Wing Anti-ice*.
- L2 The failure of multiple IMA modules. In this case, the ECAM displays the ECAM subtitle DUE TO IMA MODULE FAULT, or
  L3 For more information on CPIOM Group H4, *Refer to DSC-42-10 CPIOM Group H4*.
- L2 The activation of both the wing anti-ice system and the APU bleed. In this case, the ECAM displays the ECAM subtitle WING A-ICE NOT AVAILABLE ON APU BLEED.
  L3 The wing anti-ice system cannot operate when the bleed air is supplied by the APU.

Depending on the failure, the ECAM alert proposes appropriate actions to attempt a recovery of the wing anti-ice system if it is possible:

- If wing anti-ice is on, and provided that the engines are not at takeoff power, the flight crew can attempt an immediate recovery by applying the proposed ECAM actions, or
- The flight crew can activate the deferred procedure > WING A-ICE RECOVERY later on, as required.

Note: 1. *If the alert is only due to an IMA module failure, the ECAM displays the DUE TO IMA MODULE FAULT subtitle.*
2. *If the alert is due to the simultaneous activation of the wing anti-ice system and the APU bleed, the ECAM displays the WING A-ICE NOT AVAIL ON APU BLEED subtitle.*

ANNUNCIATIONS

Triggering Conditions:

L2 The bleed air distribution is not in the normal configuration due to the loss of one engine bleed air system and the crossbleed valve is closed.

This alert is activated when one of the following applies:

1. One engine bleed air system is lost, and the crossbleed valve is automatically closed (due to hot air leak or an engine fire).

   This is indicated by one of the following alerts:
   - AIR APU BLEED LEAK, or
   - AIR ENG 1(2) BLEED LEAK, or
   - AIR L(R) WING A-ICE LEAK, or
   - AIR L(R) WING LEAK, or
   - AIR LEAK ON FUEL INERTING, or
   - AIR PACK 1(2) LEAK, or
   - ENG 1(2) FIRE.
2. One engine bleed air system is lost, and the crossbleed valve did not open.

   This is indicated by:
   - The AIR XBLEED FAULT alert, and
   - One of the following alerts:
     - AIR ENG 1(2) BLEED FAULT, or
     - AIR ENG 1(2) BLEED LEAK, or
     - AIR ENG 1(2) BLEED TEMP LO, or
     - ENG 1(2) SHUTDOWN.

L12

STATUS

INFO

NO BLEED 1(2) AT LO ENG PWR

At low engine thrust settings, the air pressure from the IP stage is not sufficiently high. Therefore, no bleed is available from the affected engine.

AIR ENG 1+2 BLEED FAULT

Applicable to: ALL

Ident.: PRO-ABN-AIR-3621W250-00023694.0001001 / 08 JUL 16

ANNUNCIATIONS

Triggering Conditions:

L2 The engine bleed supply is lost on both sides. The double failure may be due to a combination of the following failures:

- Bleed overtemperature
- Bleed overpressure
- Bleed low pressure
- Bleed air system control failure
- Loss of reverse flow protection
- Bleed leaks.

For more information on the engine bleed air system, *Refer to DSC-36-10-20 Engine Bleed Air System*.

L2 With the AIR ENG 1+2 BLEED FAULT procedure, the ECAM takes into account the combination of failures leading to the loss of both engine bleed air systems.

Then, the ECAM proposes appropriate actions: if an engine bleed can be reset, the ECAM proposes a reset to recover this engine bleed. With certain failures, such as a bleed leak, the reset is not possible.

If an ENG 1(2) BLEED reset is possible, the ECAM will propose up to two ENG 1(2) BLEED reset.

Continued on the following page

AIR ENG 1+2 BLEED FAULT **(Cont'd)**

Ident.: PRO-ABN-AIR-3621W250-00023696.0001001 / 03 JUL 20

2 ● **Depending on the failure case, the following subtitles may appear:**

LEFT(RIGHT) LEAK

ENG 1(2) BLEED LEAK

APU BLEED LEAK

■ **If engine bleed resets are not possible:**

L2 The bleed air system is lost and must be secured.
The descent is initiated to anticipate a loss of cabin pressurization.

L1 DESCENT TO FL 100/MEA-MORA.......INITIATE
ENG 1+2 BLEED.......OFF

- ● **If the left side of the bleed air system has to be isolated:**
  APU BLEED.......OFF

WING A-ICE.......OFF
AVOID ICING CONDs
MAX FL: 100/MEA-MORA

■ **If an engine bleed reset is possible at least on one side:**

L2 Up to two engine bleed resets will be proposed by the ECAM, depending on the conditions. If the reset is possible only on one engine bleed, the other engine bleed reset will not be proposed.

L1 AFTER 15 S: ENG BLEED (POSSIBLE SIDE).......OFF THEN ON

- ■ **If at least one engine bleed air system is recovered:**
  ENG 1(2) BLEED RECOVERED

  L2 The ECAM displays the ENG 1(2) BLEED RECOVERED line if:
  - The corresponding engine bleed air system is recovered, and
  - The flight crew did not try the other engine bleed reset.

- L1 ■ **IF NO ENG BLEED RECOVERED:**
  DESCENT TO FL 100/MEA-MORA.......INITIATE

  L2 The descent is initiated to anticipate a loss of cabin pressurization.

  - L1 ● **If there is no leak on the left side of the bleed air system:**
    APU.......START

AUTO FLT EMER DESCENT (Cont'd)

CREW OXY MASKS.......USE
SIGNS.......ON
EMER DESCENT.......INITIATE

Initiate the emergency descent with use of the AUTO EMER DESCENT function.

L3 *For more information on the use of the AUTO EMER DESCENT function, Refer to FCTM/PR-AEP-MISC EMER DESCENT.*

L1
- **If A/THR is not active:**

  ALL THR LEVERS.......IDLE

L2 *If the A/THR is active, check A/THR is at IDLE on the ED.*

L1 SPEED BRAKES LEVER.......FULL
SPEED.......MAX / APPROPRIATE

The flight crew may extend the landing gear when the speed is below VLO.

ATC.......NOTIFY

L2 *Notify ATC of the nature of the emergency, and state intentions.*

L1 EMER DESCENT (PA).......ANNOUNCE

L2 *The flight crew must inform the cabin crew and the passengers of the emergency descent, via the Passenger Address (PA).*

L1 ATC SQUAWK.......7700

L2 *When the flight crew engages the AUTO EMER DES function, the aircraft automatically squawks 7700.*

L1 MAX FL : 100/MEA-MORA

L2 *The initial descent altitude target is MORA $_{dISA/dP}$. The flight crew should consider to readjust the AFS altitude target according to the MORA displayed on ND. The flight crew should be aware that a PULL or PUSH action on the ALT knob will disengage the EMER DES mode and remove the AUTO FLT EMER DESCENT procedure from the WD.*

L1
- **CAB ALT ABOVE 14000 FT:**
  - **YES**

    PAX OXY MASK MAN ON.......PRESS

L2 *If the cabin altitude is above 13 800 ft, the passenger oxygen masks will automatically drop. If the automatic drop did not operate, the oxygen masks of the passengers releases when the flight crew presses the MASK MAN ON pb.*

Continued on the following page

AUTO FLT EMER DESCENT (Cont'd)

Notify the cabin crew when the aircraft reaches a safe flight level, and when cabin oxygen is no more necessary

L1
- **WHEN DESCENT ESTABLISHED:**

  CREW OXY MASKS DILUTION..........NORM

  To save oxygen, set the EMER/100%/NORM selector to NORM.
  With the EMER/100%/NORM selector set to 100 %, oxygen quantity may be insufficient to cover the entire emergency descent profile.
  Ensure that crew communication is established with oxygen masks. Avoid the continuous use of the interphone to minimize interference with the breathing noise in the oxygen mask.

FMS SWTG..BOTH ON 2(1)

L2 *After the flight crew sets the FMS selector to BOTH ON 2(1), the PFD, the ND, and the MFD display FMS 2(1) data on both sides of the cockpit.*
The flight crew can still use AP 1(2). AP 1(2) uses the long-term guidance data from FMS 2(1).

L3 *After the flight crew sets the FMS selector to BOTH ON 2(1):*
- *The MFD of the Captain(First Officer) displays the ACTIVE/F-PLN page*
  The MFD system menu displays the same label as on the MFD of the First Officer(Captain). The fact that both MFD system menus display the same label indicates that both sides of the cockpit display data that comes from the same FMC.
- *The ND of the Captain(First Officer) displays the OFFSIDE FM CONTROL message*
  This message indicates that the active FMC on the side of the First Officer(Captain) provides the FMS data for the side of the Captain(First Officer).
- *On the EFIS CP of the Captain(First Officer), the flight crew can no longer select:*
  - *The FMS display options: CSTR, WPT, VORD, NDB, and ARPT*
  - *The ND mode (except the ROSE-VOR and ROSE-LS modes)*
  - *The ND range (except the ZOOM position).*

  The flight crew manages these display options via the EFIS CP of the First Officer(Captain).

AUTO FLT FMS 1(2) REJECTED
RNP AR CAPABILITY DOWNGRADED

Applicable to: ALL

Ident.: PRO-ABN-AUTO_FLT-2280W020-00012628.0001001 / 01 JUL 14

ANNUNCIATIONS

Triggering Conditions:

L2 The flight guidance system rejects the FMS1(2) data, when an RNP AR approach procedure is engaged.
For more information, *Refer to DSC-22-FMS-40 FMC Data Not Valid during a RNP AR Procedure*.

AVIONICS NETWORK SWITCH/CABLE FAULT (NETWORK DEGRADED) (Cont'd)

Ident.: PRO-ABN-AVNCS-4230W1401-00024939.0001001 / 03 JAN 19

L2 Depending on the failed switches or cables, communication between some aircraft systems is no longer possible. The ECAM will trigger the applicable system alerts below the AVIONICS NETWORK SWITCH/CABLE FAULT [NETWORK DEGRADED] alert.
Some indications on several displays (e.g. on the SD) may be lost: However, the corresponding systems may continue to operate normally.
In any case, the following systems will be available:

FLY	F/CTL normal law Stall warning PFD with attitude, altitude, heading, airspeed and barometric reference indications AP in selected mode (1) Auto Trim Manual thrust, with engine parameters displayed on ED L/G gravity extension Slats/Flaps Ground spoilers Thrust reversers Normal braking, with manual braking and antiskid
NAVIGATE	ISIS with ILS1/GLS1 approaches in APPR 1. Tuning via RMPs ISIS with A/C position, heading and track ND ROSE-NAV with a range of 80 NM Backup Trajectory up to 160 NM with active F-PLN RA auto callouts FOB and GW computation. Depending on the failure, the FOB and GW indications may be displayed with a degraded accuracy.
COMMUNICATE	Voice communication (VHF/HF). Tuning via RMPs Passenger Address/Cabin Intercom Transponder mode A
MANAGE SYSTEMS	FWS 1 and 2 WD CAB PRESS manual mode XBLEED selector APU Engine anti-ice Windshield and window heating on F/O side Automatic probe heating Manual deployment of cabin oxygen masks OIS, with OIS keyboard

(1) *Depending on the failed switches or cables, the EFIS may not display the Flight Guidance data.*

[MEM] LOSS OF BRAKING

Ident.: PRO-ABN-BRAKES-00016272.0001001 / 24 MAY 17
Applicable to: ALL

- **If no braking:**

  REV...MAX

  L2 *If needed, the flight crew may keep maximum reverse thrust until full aircraft stop.*

  L1 BRAKE PEDALS...RELEASE

  L2 *When the flight crew sets the A-SKID to OFF, the control of the braking is transferred from the BCS to the RBCU, and the emergency braking mode is activated. Consequently the PF should release the brake pedals before the PM selects the A-SKID to OFF. This action avoids brutal braking application.*
  For more information on the emergency braking mode, Refer to Emergency Braking.

  L1 A-SKID...ORDER

  L2 *The PF orders the PM to select the A-SKID to OFF.*

  L1 A-SKID...OFF
  BRAKE PEDALS...PRESS

  L2 *The pressure of the brakes is automatically limited.*

BRAKES HOT (Cont'd)

Ident.: PRO-ABN-BRAKES-3247W010-00014661.0005001 / 29 APR 20

- **On ground:**

PARK BRK..PREFER CHOCKS

L2 *The parking brake handle should not be set to ON in order to prevent mechanical damage to the brake component.*

L1 DELAY T.O FOR COOLG

L2 *Delay takeoff until the alert goes off. The alert goes off when the temperature of the hottest brake is at or lower than 290 °C.*
The flight crew can use the brake cooling time table to estimate a brake cooling time based on the current temperature of the hottest brake.

In order to use the brake cooling time table:
- *Make sure that the aircraft is stopped,*
- *Wait at least 15 min,*
- *Check the temperature of the hottest brake on the WHEEL SD page,*
- *Check the outside temperature (SAT) on the permanent data below the SD,*
- *Enter the table with both temperature values and read the estimated brake cooling time (in minutes) depending on the temperature target (300 °C, 250 °C, 200 °C, 150 °C, 100 °C).*

Estimated Brake Cooling Time (min)

Hottest Brake Temperature		*300 °C*	*350 °C*	*400 °C*	*450 °C*	*500 °C*	*550 °C*	*600 °C*	*650 °C*	*700 °C*
Temperature Target	*SAT*									
300 °C	*-54 °C*	*0*	*14*	*26*	*37*	*47*	*56*	*64*	*72*	*79*
	15 °C	*0*	*17*	*32*	*45*	*56*	*66*	*75*	*84*	*92*
	54 °C	*0*	*19*	*36*	*50*	*62*	*73*	*84*	*93*	*101*

	15 °C	*127*	*144*	*159*	*172*	*183*	*193*	*202*	*211*	*219*
	54 °C	*176*	*195*	*212*	*226*	*238*	*249*	*260*	*269*	*277*

Continued on the following page

BRAKES HOT (Cont'd)

Example:
- *SAT = 15 °C*
- *Temperature of the hottest brake on the WHEEL SD page = 450 °C*
- *In order to reach a temperature of 250 °C, the estimated time for brake cooling is 66 min.*

Note:
- *For intermediate values, the flight crew interpolates linearly.*
- *The estimated brake cooling times do not take into account the effect of the wind.*
- *To increase the precision of the estimation, the flight crew can use the table several times, using always as reference the temperature of the hottest brake displayed on the WHEEL SD page.*

L1 ■ **In flight:**

PERF (L/G DOWN)....................COMPUTE

- **PERF PERMITS L/G DOWN ?**
  - **YES**

    MAX SPEED: 250/.55

    L/G....................DOWN FOR COOLG

    If the L/G lever is UP, wait for the landing gear uplock. Then select the L/G lever DOWN.

- **If the aircraft is above FL 100, and below FL 160:**

  CREW OXY MASKS.......... USE
  SIGNS.......... ON
  DESCENT.......... INITIATE
  CABIN CREW.......... ADVISE

- **If the aircraft is above FL 160:**

  CREW OXY MASKS.......... USE

  EMER DESCENT

  EMER DESCENT.......... INITIATE

  Initiate the emergency descent with one of the following techniques:
  - *Use of the AUTO EMER DESCENT function*
  - *Use of selected guidance via the AFS CP.*

L3 *For more information on the two techniques for emergency descent initiation, Refer to FCTM/PR-AEP-MISC EMER DESCENT.*

L1
  - **If AUTO EMER DESCENT function is automatically engaged:**

    AUTO EMER DES ENGAGED

    - **When automatic emergency descent is completed:**

      AUTO EMER DES COMPLETED

  - **If A/THR is not active:**

    ALL THR LEVERS.......... IDLE

L2 *If A/THR is either armed or active, check A/THR is at IDLE on the ED.*

L1 SPEED BRAKE LEVER.......... FULL

CAUTION	Descent at the maximum appropriate speed. If structural damage is suspected, use the flight controls with care and limit speed as appropriate.

SPEED.......... MAX / APPROPRIATE

The flight crew may extend the landing gear when the speed is below VLO.

ATC.......... NOTIFY

L2 *Notify ATC of the nature of the emergency, and state intentions.*

L1 EMER DESCENT (PA).......... ANNOUNCE

L2 *The flight crew must inform the cabin crew of the emergency descent, via the Passenger Address (PA).*

Continued on the following page

CAB PRESS EXCESS CAB ALT (Cont'd)

L1 ATC SQUAWK 7700..CONSIDER

L2 *Unless otherwise specified by ATC, squawk the emergency 7700 transponder code.*

L1 MAX FL : 100/MEA-MORA

L2 *The minimum altitude must take into account:*
- *The Minimum Safe Altitude (MSA)*
- *Oxygen requirements*
- *The turbulence, in order to minimize passenger discomfort*
- *The low Outside Air Temperature (OAT), in order to minimize passenger discomfort, when the aircraft cabin is ventilated with the ram air.*

The initial descent altitude target is MORA $_{dISA/dP}$. The flight crew should consider to readjust the AFS altitude target according to the MORA displayed on ND. The flight crew should be aware that a PULL or PUSH action on the ALT knob will disengage the EMER DES mode.

L1 ● **CAB ALT ABOVE 14 000 ft ?**

● **YES**

PAX OXY MASK MAN ON..PRESS

L2 *This action on the PAX OXY MASK MAN ON pb confirms that the oxygen masks drop in the cabin, in the case they do not automatically drop when the cabin altitude is above 13 800 ft.*
When the aircraft reaches a safe flight level and when the use of oxygen masks is no longer necessary, notify the cabin crew.

L1 ● **WHEN DESCENT ESTABLISHED**

● **If the aircraft is above FL 100:**

CREW OXY MASKS DILUTION..NORM

L2 *To save oxygen, set the N/100% selector to N.*
If the N/100% selector is set to 100 %, the oxygen quantity may be not sufficient to achieve the entire emergency descent profile.
Ensure that crew communication is established with oxygen masks. Avoid continuous use of the interphone, in order to minimize interference with the breathing noise in the oxygen mask.

L1 ● **WHEN DIFF PR <2 PSI & FL <100/MEA-MORA**

RAM AIR..ON

CAB PRESS EXCESS DIFF PRESS (Cont'd)

Ident.: PRO-ABN-CAB_PRESS-2131W070-00007261.0001001 / 03 JUL 14

- **In flight:**

  PACK 1 .... OFF
  PACK 2 .... OFF

L2 Both packs are shut off, in order to cut off the air supply to the cabin. This enables to decrease the cabin pressure and the cabin differential pressure.

L1
  - **If the alert is triggered above FL 100:**

    DESCENT TO FL 100/MEA-MORA .... INITIATE

ASSOCIATED PROCEDURES

AIR PACK 1+2 FAULT

Refer to procedure.

CAB PRESS EXCESS NEGATIVE DIFF PRESS

Applicable to: ALL

Ident.: PRO-ABN-CAB_PRESS-2131W080-00005718.0001001 / 03 JUL 14

ANNUNCIATIONS

Triggering Conditions:

L2 The differential pressure is below -0.72 PSI. This alert is triggered, if, despite the negative and overpressure relief valves, the negative differential pressure becomes too low.
This alert has priority over all alerts that request an EMER DESCENT procedure.

CAB PRESS INHIBITED BY DOORS

Applicable to: ALL

Ident.: PRO-ABN-CAB_PRESS-2131W140-00005720.0001001 / 03 JUL 14

ANNUNCIATIONS

Triggering Conditions:

L2 If one door is not closed, latched and locked, or in the case of a door failure (electrical or mechanical failure), the pressurization of the aircraft will be prevented during take-off or at lift-off by keeping the outflow valves in the fully open position.

L3 *Note:* *The packs will be switched-off.*

L2 *Note:* *The door status is frozen within the CPCS when the takeoff power is set. If the abnormal door status is detected at takeoff, the alert is triggered after the climb phase (1 500 ft) to avoid a rejected takeoff.*

SOFT KBD AVAIL ON MFD FOR CAPT(F/O)
FOR CAPT(F/O) OIS : USE OIS KEYBOARD

L2 *The soft keyboard is available on the MFD only.*
The soft keyboard automatically appears on the MFD, if the flight crew edits a field.
The flight crew can manually display the soft keyboard via the KBD key of the Cursor Control Device (CCD).
Use the FMS functions on the MFD instead of the ND.
Via the soft keyboard and the CCD, all functions remain available on the MFD, but not on the ND, and not on the OIS.

Ident.: PRO-ABN-CDS-3160W050-00003205.0001001 / 03 JUL 14

ANNUNCIATIONS

Triggering Conditions:

L2

The CDS sends the information to be displayed to the applicable DU, and also to another DU for monitoring purposes.
The CDS DISPLAY DISAGREE alert is triggered, if the information sent to the DU that displays the information disagrees with the information sent to the DU that monitors the information.
As a result, the affected DU (i.e. the DU that displays the information) is not reliable.

In addition to the CDS DISPLAY DISAGREE alert, depending on the affected DU, one of the following messages appears on both PFDs and both NDs:

- CHECK CAPT OUTR DU, if the affected DU is the CAPT OUTER DU
- CHECK CAPT INR DU, if the affected DU is the CAPT INNER DU
- CHECK F/O OUTR DU, if the affected DU is the F/O OUTER DU
- CHECK F/O INR DU, if the affected DU is the F/O INNER DU
- CHECK CTR UPPR DU, if the affected DU is the CENTER UPPER DU
- CHECK CTR LWR DU, if the affected DU is the CENTER LOWER DU
- If HUD ◁ :
  - CHECK CTR UPPR DU & CAPT HUD, if the affected DU is the CENTER UPPER DU
  - CHECK CTR LWR DU & F/O HUD, if the affected DU is the CENTER LOWER DU.

- **If ENG 2 is running:**

  COMMERCIAL 1+2 .... OFF

  L2 *If this alert is not due to the loss of engine 2, the crew shall switch off the commercial loads because these busbars losses may be linked to commercial loads.*

L1 APU .... CONSIDER

L2 *As only one power source remains for the whole aircraft, the crew shall consider the use of APU.*

L1
- **If there is fuel in the center tank:**

  L2 As the CTR TK L PMP is inoperative, the fuel from the center tank is only usable by ENG 2. To avoid a fuel imbalance, both crossfeed valves must be opened to feed both engines from the center tank, except if a fuel leak is suspected.

  L1
  - **If FUEL LEAK SUSPECTED:**
    - **YES**

      FUEL LEAK PROC .... APPLY
    - **NO**

      CROSSFEED A .... ON

      CROSSFEED B .... ON

      L2 *The remaining center tank pump is enough to feed both engines.*

L1
- **WHEN CTR TK EMPTY, or after landing:**

  CROSSFEED A .... OFF

  CROSSFEED B .... OFF

ELEC APU GEN FAULT

Applicable to: ALL

Ident.: PRO-ABN-ELEC-2423W120-00006002.0001001 / 02 JUL 14

ANNUNCIATIONS

Triggering Conditions:

L2 The APU GEN is failed.

L3 The APU generator fails, in the case of:

- An overload (if load shedding is not sufficient)
- Abnormally low intensity of the current (lower than 2 A)
- Abnormally low APU generator voltage (lower than 206 V)
- Abnormally high APU generator voltage (higher than 257 V)
- A short-circuit
- A failure of the APU generator contactor
- An overheat.

ELEC DC 2 + DC EMER 1 BUS FAULT

Applicable to: ALL

Ident.: PRO-ABN-ELEC-24CDSMSG1-00021184.0001001 / 02 JUL 14

ANNUNCIATIONS

Triggering Conditions:

L2 Both DC 2 and DC EMER 1 busbars are lost.

As a consequence, FWS 1 and FWS 2 are failed, and one or more CPIOMs of the following CPIOM groups are failed:

- CPIOM group H3, or
- CPIOM group H4, or
- CPIOM group H6, or
- CPIOM group J2, or
- CPIOM group J5, or
- CPIOM group J7.

For more information about the CPIOM groups, *Refer to DSC-42-10 CPIOM*.

L3 The CDS, instead of the FWS, displays the ELEC DC 2 + DC EMER 1 BUS FAULT alert.

Other Inhibition:

L2 The ELEC DC 2 + DC EMER 1 BUS FAULT alert is displayed on ground, if the aircraft speed is less than 50 kt.

Continued on the following page

ELEC DC 2 + DC EMER 1 BUS FAULT (Cont'd)

Ident.: PRO-ABN-ELEC-24CDSMSG1-00021185.0003001 / 26 JUL 17

L2 Due to the fact that FWS 1 and FWS 2 are failed:

- The ECAM will no longer trigger alerts and dispatch messages, audio indicators will no longer sound, and the MASTER lights will no longer come on
- The flight crew can no longer display the normal checklists
- The approach and landing capability is limited to APPR1.

During descent and approach preparation, the flight crew must regularly check the general status of all aircraft systems on:

- The overhead panel
- The available SD pages.

The flight crew should use the FCOM on the OIS to display any necessary procedures.

Note: *FWS 1 and FWS 2 are failed. As a result, the FWS is not able to manage the space between the lines of text of the ELEC DC 2 + DC EMER 1 BUS FAULT procedure. Each line of text of the procedure is assigned to an action or information that results from the failure of a specific CPIOM. A line of text appears, only if this line of text is related to the failed CPIOM. The space between two displayed lines of text corresponds to the lines of text that are not displayed, because these lines of text are related to the CPIOMs that are not failed.*
The following illustration illustrates the entire alert display, in the case of the failure of CPIOM group J1 combined with all other CPIOM groups.

L2 *The SD pages are no longer available for the systems that the failed CPIOM group hosts. In addition, the failure of the CPIOM group can affect the information displayed on the SD pages of other systems.*
Regularly check the overhead panel for local warnings, and the SD pages for system checks.

L1
- **If CPIOMs (H43 and H44) are failed:**

AVOID ICING CONDITIONS

L2 *Depending on CPIOM failures, the engine anti-ice or the wing anti-ice are failed. Therefore, avoid icing conditions.*

L1
- **If CPIOM J51 is failed:**

ATC COM VOICE ONLY / USE STBY RAD NAV

L2 *All ATC datalink applications (ADS, CPDLC, digital ATIS, etc.) are failed.*

L1
- **If CPIOMs H41 and H42 is failed:**

CABIN ALT MODE...MAN

L2 *The automatic control mode of the cabin pressurization system is failed.*

L1 WHEN ACFT FL>250 : CAB ALT TRGT...7000FT
WHEN ACFT FL<250 : CAB ALT TRGT...LDG ELEVN

- **If CPIOMs (H61 or H63) and (H62 or H64) are failed:**

L/G GRVTY EXTN ONLY (MAX SPEED 220 KT)

L2 *The following systems and functions are failed:*
- *Autobrake*
- *Steering*
- *Normal landing gear extension/retraction.*

Continued on the following page

ELEC DC 2 + DC EMER 1 BUS FAULT (Cont'd)

As a result, the landing gear extension is available by gravity only. Use the L/G GRVTY EXTN sw to extend the landing gear by gravity. Refer to deferred proc.

L1 ECAM SD & OVHD PNL....................MONITOR

L2 *The SD pages are no longer available for the systems that the failed CPIOM group hosts. In addition, the failure of the CPIOM group can affect the information displayed on the SD pages of other systems.*
Regularly check the overhead panel for local warnings, and the SD pages for system checks.

L1 LDG PERF AFFECTED : SLAT SYS 1+2 FAULT

L2 *As both slat control units are failed, landing performance will be affected. For more information on F/CTL SLAT SYS 1+2 FAULT, Refer to procedure.*

L1 FUNCTIONS NOT AVAIL :
RNP AR CAPABILITY

- **If CPIOMs (H31 or H33) and (H32 or H34) are failed:**
  FQMS 1+2 / JETTISON

- **If CPIOMs (H41 and H42) are failed:**
  VENT CTL / TEMP CTL

  L2 *Temperature regulation in the cabin is degraded. The temperature in some zones can be abnormally low.*

L1
- **If CPIOMs (H43 and H44) are failed:**
  WING A-ICE

  L2 *Wing anti-ice is failed. Therefore, avoid icing conditions.*

L1
- **If CPIOMs group (H61 or H63) and (H62 or H64) are failed:**
  L/G CTL 1+2 / N/W STEER / AUTO BRK

  L2 *The emergency braking mode is active, and the landing distance is increased. Refer to the performance module.*
  For landing, use the rudder, the differential braking, or both the rudder and the differential braking to steer the aircraft on the runway, because the nose landing gear turns freely.
  After landing, the aircraft must be towed off the runway.

L1
- **If CPIOMs J21 and J23 (or J22 and J24) are failed:**

ALL PHASES

> LDG PERF OR LS RECOVERY

Recovering a landing system may be useful if the weather is difficult at the diversion airport (e.g. low visibility).
Recovering the slat actuation enables the flight crew to extend the slats and reduce the approach speed.
Setting the GENs of the isolated side to ON, before landing, enables the systems recovery. However, it may also reignite the smoke source.

> LDG PERF OR LS RECOVERY

Recovering a landing system may be useful if the weather is difficult at the diversion airport (e.g. low visibility).

Recovering the slat actuation enables the flight crew to extend the slats and reduce the approach speed.

Setting the GENs of the isolated side to ON, before landing, enables the systems recovery. However, it may also reignite the smoke source.

FUEL CONTAMINATED

Ident.: PRO-ABN-ENG-7921W070-00021646.0001001 / 06 NOV 14

L2 The fuel is contaminated and both FOHEs are blocked. The associated bypass valves are open and the heat transfer between oil and fuel is no more active.
The control of both engines is ensured and the following stages may occur after the triggering of this ECAM alert.

If the Low Pressure (LP) fuel filter starts to clog:
- The ENG 1(2) FUEL FILTER PARTLY CLOGGED message may be displayed on the DISPATCH page,
- If the fuel contamination continues, the ENG 1(2) FUEL FILTER IN BYPASS alert associated with the ENG 1(2) FUEL FILTER IN BYPASS message may be displayed ,

As the LP fuel filter is bypassed:
- If the fuel contamination continues, the HP fuel filter starts to clog,
- If the Hydro-mechanical Monitoring Unit (HMU) is affected, the engine control is degraded and the ENG 1(2) CTL SYS FAULT alert is triggered on the WD (*Refer to procedure*).

If the engine oil temperature increases after blockage of the FOHE, the ENG 1(2) OIL TEMP HI alert may appear on the WD (*Refer to procedure*).

ENG 1(2) CTL SYS FAULT (Cont'd)

■ In flight:

● If engine control is degraded:

L2 Engine control (air system) can be degraded due to:
- HP compressor outlet pressure sensor failure (P30), or
- HP or IP bleed valve failure, or
- VSV failure.

L1 NO RAPID THR CHANGES

L2 *The flight crew must avoid rapid thrust changes.Refer to DSC-70-10-30-20 Stall*

L1 **● In the case of N1 or N2 sensor failure:**

ENG 1(2) IDLE ONLY
THR LEVER 1(2)..IDLE
LDG DIST AFFECTED
ON DRY RWY ONLY: LDG DIST AFFECTED<15 %

L2 *Landing distance computation on dry runways does not take into account the effect of the thrust reversers.*

L1 **● In the case of fuel regulation failure:**

ENG 1(2) SLOW RESPONSE

L2 *The Fuel Metering Valve (FMV) is detected jammed.*

L1 **● In the case of overthrust detection:**

L2 The FADEC automatically reduces the thrust. *Refer to DSC-70-10-30-20 Overthrust* for overthrust protection.

The overthrust protection is active when:
- The aircraft is below 16 600 ft, and
- The aircraft speed is below M 0.45.

ENG 1(2) FADEC FAULT (Cont'd)

Ident.: PRO-ABN-ENG-7325W310-00008561.0001001 / 03 DEC 15

L2 When the FADEC of the ENG 1(2) failed, the FADEC is partially or totally lost.

- Either the FADEC is partially lost and still able to control the engine, and transmits the primary engine parameters to the ED (N1, current THR, maximum THR, thrust lever position, and EGT).
- Or the FADEC is totally lost. In this case the engine is automatically shutdown and the primary engine parameters are displayed **XX**.

In both cases, ENG 1(2) secondary parameters are lost on the ENG SD page (except the N1 vibrations, N2 vibrations and N3 vibrations).

Continued on the following page

ENG 1(2) FADEC FAULT (Cont'd)

Ident.: PRO-ABN-ENG-7325W310-00008562.0002001 / 30 NOV 17

- **If A/THR engaged and the affected engine is still running:**

  THR LEVER 1(2)....................MAN ADJUST

  L2 *When the A/THR is used, the flight crew disconnects the A/THR and manually adjust THR LEVER 1(2) in order to confirm that the FADEC is inoperative.*

L1 ENG 1(2) PARAMETERS....................MONITOR

L2 *If the FADEC is partially lost, the main ENG 1(2) parameters are still displayed on the ED. Monitor these parameters in a standard way.*
The EGT is still normally displayed. However, the ENG 1(2) EGT OVER LIMIT alert will not trigger in the case of EGT exceedance. Therefore, the flight crew must closely monitor the EGT parameter of the ENG 1(2).

L1
- **ABNORM PARAMETERS ?**
  - **YES**

    L2 All primary engine parameters are displayed **XX** or are not consistent.

ANNUNCIATIONS

Triggering Conditions:

L2 The alert is triggered when N3 goes below 50 % and the ENG MASTER lever is set to on.

The FADEC automatically shuts down the engine when one of the following failures occurs:
- A shaft failure, or
- A FADEC overheat, or
- A thrust control malfunction, or
- An engine failure with a root cause not identified by the FADEC.

Note: *In that case the failure is not due to a shaft failure, a FADEC overheat, a thrust control malfunction, nor an engine stall.*

ENG 1(2) N1 HIGH VIBRATIONS (Cont'd)

Ident.: PRO-ABN-ENG-7734W010-00015286.0001001 / 06 NOV 14

L2 The engine vibration (N1 greater than 5 units for 8 s or N1 greater than 8 units for 2 s) is mainly a guideline for the flight crew to more closely monitor engine parameters.
The ECAM vibration advisory does not necessarily require any engine shutdown.

Note: *High N1 vibrations are generally associated with airframe vibrations.*

Note: *High N1 vibrations may be associated with cockpit and cabin smoke, and/or the smell of burning. This may be due to the contact of the compressor blade tip with associated seals or due to ice ingestion by the engine.*

Ident.: PRO-ABN-ENG-7734W010-00015287.0002001 / 30 NOV 17

- **ENG 1(2) ICING SUSPECTED ?**
  - **YES**

L2

An increase of N1 vibration in icing conditions, with or without engine anti-ice, may be due to fan blades and/or spinner icing.

Ice accretion on engine fan may result in a temporary increase of the EGT.

L1 A/THR..OFF
ENG 1(2)..IDLE THEN INCREASE

L2 *To shed ice, it may be necessary to perform several engine rate changes.*
During each engine run-up, increase thrust up to an appropriate setting for the flight phase.
After each engine run-up, vibrations should decrease indicating the progress of the ice shedding.
When the ice is shed, vibrations should return to normal and the flight crew can resume normal engine operation.

L1 N1 VIB VALUE..CHECK
ENG 1(2) THRUST..REDUCE AS RQRD

ENG 1(2) N1 OVER LIMIT

Applicable to: ALL

Ident.: PRO-ABN-ENG-7711W050-00015209.0001001 / 05 NOV 15

ENG 1(2) STALL

Applicable to: ALL

Ident.: PRO-ABN-ENG-7100W410-00015233.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 The FADEC detects an engine stall.

The engine stall occurs when the control of the airflow through the IP and the HP compressors is abnormal. The engine stall can be due to:
- Objects ingestion or,
- Shaft damages or,
- Adverse weather.

Refer to DSC-70-10-60 Engine Stability for engine airflow control.
The alert is inhibited during the takeoff phase from V1 to 400 ft except if the other engine is in stall condition or has failed.

ENG 1(2) STALL (Cont'd)

Ident.: PRO-ABN-ENG-7100W410-00015234.0001001 / 06 NOV 14

L2 The flight crew can identify an engine stall by:
- Sudden engine thrust dissymmetry,
- Abnormal engine noises,
- Flame out of the engine exhaust or engine inlet (for severe cases).

The flight crew can also observe:
- Fluctuating performance parameters,
- Slow or no thrust lever response,
- High EGT,
- Rapid EGT increase when the thrust lever is moved forward.

Engine stalls must be reported for maintenance action.

Ident.: PRO-ABN-ENG-7100W410-00008610.0001001 / 06 NOV 14

ENG 1(2) PARAMETERS....................CHECK

● **ABNORMAL PARAMETERS ?**

■ **YES**

ENG 1(2) MASTER ....OFF
ENG 1(2) RELIGHT PROC....................CONSIDER

L2 *ENG 1(2) RELIGHT apply, Refer to PRO-ABN-ENG [ABN] ENG RELIGHT IN FLT.*
Engine relight is at flight crew discretion.
If engine parameters are normal after engine relight, consider to switch on wing anti-ice and nacelle anti-ice of the affected engine. This action increases the stall margin, with a trade-off on EGT increase.
If stall does not occur again, continue normal engine operation.

L1 ● **If engine relight is not successful:**

Ident.: PRO-ABN-ENG-8000W410-00015237.0001001 / 09 MAR 16

ANNUNCIATIONS

Triggering Conditions:

L2 The engine start, manual or automatic, is not successful due to:
- EGT overlimit, or
- No light up, or
- ENG stall, or
- Hung start.

Note: *The EEC tries a second automatic start when the first automatic start is aborted. In the case of EGT overlimit, the EEC tries a second automatic start only if the EGT did not exceed 700 °C.*

L2 When the FADEC loses the thrust lever position, the FADEC automatically sets the engine thrust to idle or climb (MCL).
The FADEC sets idle or climb thrust according to the Mach number.
If 0.35<MACH<0.45, the FADEC adjusts to the last known valid setting.
The pilot must confirm and manually set the thrust lever in the detent corresponding to the thrust automatically set by the FADEC. This action prevents a thrust surge if the thrust lever position is recovered.
There is an alert auto recall each time the FADEC changes the thrust setting.

[ABN] F/CTL LDG WITH FLAPS LEVER JAMMED

Applicable to: ALL

Ident.: PRO-ABN-F_CTL-9027W130-00015851.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the LDG WITH FLAPS LEVER JAMMED procedure, in the F/CTL section.
The flight crew must apply this procedure when the FLAPS lever is jammed and cannot be used to extend the slats and flaps for landing.

Ident.: PRO-ABN-F_CTL-9027W130-00008225.0003001 / 03 JAN 19

■ **If the FLAPS lever is jammed at 0, 1 or 2**

FLAPS LEVER.. FORCE ONE STEP DOWN

L2 *The FLAPS lever has an override mechanism that the flight crew can use, if the FLAPS lever is jammed. The override mechanism allows to extend the slats/flaps one step (for example from 0 to 1, from 2 to 3).*
To use the override mechanism, the flight crew should apply a strong force to the lever, without pulling the lever out of detent.
The override mechanism is reversible.

L1 ● **If the FLAPS lever is jammed at 0 or 1**

[MFD SURV] TAWS FLAP MODE...OFF

NO AUTOLAND

■ **If the FLAPS lever is jammed at 3**

[ABN] F/CTL SPEED BRAKES LEVER JAMMED

Applicable to: ALL

Ident.: PRO-ABN-F_CTL-9027W150-00015853.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the SPEED BRAKES LEVER JAMMED procedure, in the F/CTL section.

L3 The flight crew must apply this procedure when the SPEED BRAKE lever is not available.

Ident.: PRO-ABN-F_CTL-9027W150-00014908.0001001 / 06 NOV 14

L2 When the speed brakes lever is jammed, the manual control of the speed brakes is lost. However, the flight crew can retract the speed brakes in flight and the ground spoilers can deploy after landing.

Ident.: PRO-ABN-F_CTL-9027W150-00014909.0003001 / 03 JAN 19

- **If the speed brakes are deflected:**

  FOR AUTO RETRACT : THR LVRs TOGA

  L2 *The TOGA thrust lever position automatically retracts the speed brakes.*

  L1 EXPECT AP/FD GA MODE ENGAGEMENT

  L2 *If the flaps and slats are not retracted the SRS mode will engage at the FMA.*

  L1 GND SPLRs WILL EXTEND NORMALLY

  L2 *For landing, the PRIMs will consider the ground spoilers as armed in the case of speed brakes lever jammed in the deflected position.*

L1
- **If the speed brakes are retracted and the ground spoilers are not armed:**

  GND SPLRs WILL EXTEND AT REV SELECTION

  L2 *At 500 ft the F/CTL GND SPLRS NOT ARMED will appear.*
  However, the ground spoilers will deploy if the flight crew uses the reversers after landing. As a consequence the autobrake will activate, if the autobrake is selected.

L1
- **If the ground spoilers are already armed:**

  FOR LDG : KEEP GND SPLRs ARMED

  L2 *Ground spoilers will deploy after landing.*

Ident.: PRO-ABN-F_CTL-2790W170B-00024176.0001001 / 26 JUL 17

L2 When the AP is not engaged:

- The pedals are easy to move but do not command the rudders
- The manual rudder trim is lost

Note: For some failure cases, the rudder pedals may reflect the manual rudder trim setting but do not command the rudders.

- Yaw damping and turn coordination remain available.

When the AP is engaged, for some failure cases, the rudder pedals no longer reflect the AP orders. NWS control via the rudder pedals is lost. The steering handwheel remains available for NWS control.

Ident.: PRO-ABN-F_CTL-2790W170B-00024177.0001001 / 26 JUL 17

AP : KEEP ON

L2 *The autopilot normally controls the rudder.*

L2 In the case of failure in flight of the ADGB while the flap cruise deployment function is active, the flap system launches an automatic recovery procedure to realign the flaps to the 0 ° position.
This ECAM alert and associated procedure is displayed when the automatic recovery procedure is not successful and the position of the flaps leads an increase of the fuel consumption.

FLAP RETRACTION INHIBITED
SLATS AVAIL

L2 *The slats operate normally when the FLAPS lever is used.*

L1 USE SELECTED SPEED

L2 *To prepare the aircraft for landing, the managed speed is not adapted in the case of abnormal slats/flaps configuration. Therefore, the flight crew must use the selected speed to decelerate the aircraft to the approach speed, as follows:*

- *Decelerate the aircraft toward the VFE NEXT-5 kt. In the case of turbulence, to avoid VFE exceedance, the flight crew may decide to decelerate to a lower speed but above the VLS.*
- *When the aircraft reaches the selected speed, the FLAPS lever can be set one step down.*

The above steps are repeated until the FLAPS lever is set to 3.
When the landing configuration is established, aircraft can be decelerated to the computed approach speed.

Note: The VFE NEXT displayed on the PFD takes into account the abnormal slats/flaps configuration.

L1 FOR VFE : USE PFD

L2 *The ECAM and the PFD speed scale display the VFE that is associated with the current abnormal configuration. For more information, Refer to DSC-27-20-20 Configurations.*

L1 FUEL CONSUMPT INCRSD
FMS PRED UNRELIABLE WITHOUT ACCURATE FMS FUEL PENALTY INSERTION

The FMS predictions are not correct.

- **If the flaps are in CONF 3 or lower when the retraction of the flaps is inhibited:**

  FOR LDG : FLAP LVR 3

  L2 *The slats/flaps configuration is maintained in the case of a go-around. Therefore the approach should not be performed in CONF FULL.*

  L1 FOR GA : KEEP S/F CONF

  L2 *In the case of a diversion, the slats can be retracted after a go-around.*

L2 Once locked, the wing-tip brakes cannot be unlocked in flight. Therefore the procedure is the same as the F/CTL FLAP SYS 1+2 FAULT, without recycling the FLAPS lever.
The Flap Load Relief System (FLRS), the Auto Retraction System (ARS) and Auto Extension System (AES) are lost.
The slats cruise baulk and slats alpha-lock functions remain available.

Continued on the following page

F/CTL FLAPS LOCKED (Cont'd)

Ident.: PRO-ABN-F_CTL-2750W040-00008234.0003001 / 03 JAN 19

USE SELECTED SPEED

L2 *To prepare the aircraft for landing, the managed speed is not adapted in the case of abnormal slats/flaps configuration. Therefore, the flight crew must use the selected speed to decelerate the aircraft to the approach speed, as follows:*

- *Decelerate the aircraft toward the VFE NEXT-5 kt. In the case of turbulence, to avoid VFE exceedance, the flight crew may decide to decelerate to a lower speed but above the VLS.*
- *When the aircraft reaches the selected speed, the FLAPS lever can be set one step down.*

The above steps are repeated until the FLAPS lever is set to 3.
When the landing configuration is established, aircraft can be decelerated to the computed approach speed.

Note: The VFE NEXT displayed on the PFD takes into account the abnormal slats/flaps configuration.

L1 FOR VFE : USE PFD

L2 *The ECAM and the PFD speed scale display the VFE that is associated with the current abnormal configuration. For more information, Refer to DSC-27-20-20 Configurations.*

L1 ● **If flaps position is less than 3:**
[MFD SURV] TAWS FLAP MODE...OFF

● **If the position of the flaps leads to an increase of the fuel consumption:**
FUEL CONSUMPT INCRSD
FMS PRED UNRELIABLE WITHOUT ACCURATE FMS FUEL PENALTY INSERTION
The FMS predictions are not correct.

FOR LDG : FLAP LVR 3

L2 *Note: The reduced drag causes the aircraft to decelerate more slowly. Therefore, it is recommended that the aircraft is at the landing configuration and approach speed before starting the final approach.*

L1 FOR GA : KEEP S/F CONF

L2 *In the case of a diversion, the slats can be retracted after a go-around.*

F/CTL PART(MOST) SPLRS FAULT **(Cont'd)**

Ident.: PRO-ABN-F_CTL-2760W250-00008146.0001001 / 02 OCT 14

L2 When a spoiler is failed, the symmetric spoiler:
- Is inhibited for ground spoiler and speed brakes function
- Remains available for roll control.

For more information on the behavior of a spoiler in the case of failure, *Refer to Spoilers*.
In case of the loss of four pairs of roll spoilers (spoilers 3 to 7), the flight control laws revert to Alternate. AP, FD and A/THR remain available.

Continued on the following page

F/CTL PART(MOST) SPLRS FAULT (Cont'd)

Ident.: PRO-ABN-F_CTL-2760W250-00008147.0008001 / 03 JAN 19

- **If flaps retraction is inhibited by the PRIMs:**

FLAP RETRACTION INHIBITED

L2 *When a spoiler is failed in the downward position, flaps retraction may damage the spoiler's structure. In that case, the PRIMs inhibit the flaps retraction.*

L1 SLATS AVAIL

L2 *The slats operate normally when the FLAPS lever is used.*

L1 USE SELECTED SPEED

L2 *To prepare the aircraft for landing, the managed speed is not adapted in the case of abnormal slats/flaps configuration. Therefore, the flight crew must use the selected speed to decelerate the aircraft to the approach speed, as follows:*

- *Decelerate the aircraft toward the VFE NEXT-5 kt. In the case of turbulence, to avoid VFE exceedance, the flight crew may decide to decelerate to a lower speed but above the VLS.*
- *When the aircraft reaches the selected speed, the FLAPS lever can be set one step down.*

The above steps are repeated until the FLAPS lever is set to 3.
When the landing configuration is established, aircraft can be decelerated to the computed approach speed.

Note: The VFE NEXT displayed on the PFD takes into account the abnormal slats/flaps configuration.

L1 FOR VFE : USE PFD

L2 *The ECAM and the PFD speed scale display the VFE that is associated with the current abnormal configuration. For more information, Refer to DSC-27-20-20 Configurations.*

L1
- **If the position of the failed spoiler(s) is(are) lost:**

FUEL CONSUMPT INCRSD
FOR BETTER RANGE : REDUCE CRZ MACH/SPD
FMS PRED UNRELIABLE WITHOUT ACCURATE FMS FUEL PENALTY INSERTION

The FMS predictions are not correct.

L2 *If the PRIMs still know the position of the failed spoilers, this line is not displayed. Instead, if the position of the failed spoilers impact the fuel consumption, the F/CTL SPLRS PARTLY EXTENDED alert is displayed on the WD.*

L1 EXPECT FUEL PENALTY VARIATIONS

Continued on the following page

F/CTL PART(MOST) SPLRS FAULT **(Cont'd)**

- **If flaps retraction is inhibited by the PRIMs and the aircraft is not in CONF FULL:**

  FOR LDG : FLAP LVR 3

  L2 *The slats/flaps configuration is maintained in the case of a go-around. Therefore the approach should not be performed in CONF FULL.*

  L1 FOR GA : KEEP S/F CONF

  L2 *In the case of diversion, the slats can be retracted after a go-around.*

L1 LDG DIST AFFECTED

- **If the position of the failed spoiler(s) is(are) not lost and the failed spoiler(s) impact(s) the fuel consumption:**

L12

ASSOCIATED PROCEDURES

F/CTL SPLRs PARTLY EXTENDED

This alert is displayed only when the failure of the spoiler(s) affect(s) the fuel consumption. It may be displayed immediately or some time after the failure once the drift (if any) is established (Refer to PRO-ABN-F_CTL F/CTL SPLRs PARTLY EXTENDED).

- **If at least four pairs of roll spoilers (spoilers 3 to 7) are failed:**

L12

ASSOCIATED PROCEDURES

F/CTL ALTN LAW (PROT LOST)

The flight control laws revert to Alternate. AP, FD and A/THR remain available. Refer to PRO-ABN-F_CTL F/CTL ALTN LAW (PROT LOST)

F/CTL PITCH TRIM/FMS/CG DISAGREE

Applicable to: ALL

Ident.: PRO-ABN-F_CTL-2740W100-00004753.0001001 / 03 JUL 14

ANNUNCIATIONS

Triggering Conditions:

L2 When the T.O CONFIG pb on the ECP is pressed, or when the thrust levers are set to FLEX or TOGA, there is a discrepancy between:
- The position of the pitch trim for takeoff, displayed on the Pitch Trim Display, at the bottom of the PFD
- The takeoff CG of the load and trim sheet, entered in the FMS (*Refer to DSC-22-FMS-20-20-20 THS FOR Entry Field*)
- The actual CG, computed by the FQMS, displayed in the permanent data of the System Display, and also displayed on the Pitch Trim Display, at the bottom of the PFD.

RNP AR CAPABILITY DOWNGRADED

L2 *The line is only displayed during RNP AR operations.*

L1 [RESET PNL : D2] SLATS 1 .... RESET
[RESET PNL : U2] SLATS 2 .... RESET

- **If two SLAT systems are failed during an RNP approach:**
  MINIMUM LIMITED TO RNP 0.30
- **If the aircraft is below 22 000 ft and the speed is below 265 kt:**
  FOR VFE : USE PFD

L2 *The ECAM and the PFD speed scale display the VFE that is associated with the current abnormal configuration. For more information, Refer to DSC-27-20-20 Configurations.*

L1 USE SELECTED SPEED

L2 *To prepare the aircraft for landing, the managed speed is not adapted in the case of abnormal slats/flaps configuration. Therefore, the flight crew must use the selected speed to decelerate the aircraft to the approach speed, as follows:*
- *Decelerate the aircraft toward the VFE NEXT-5 kt. In the case of turbulence, to avoid VFE exceedance, the flight crew may decide to decelerate to a lower speed but above the VLS.*
- *When the aircraft reaches the selected speed, the FLAPS lever can be set one step down.*

The above steps are repeated until the FLAPS lever is set to 3.
When the landing configuration is established, aircraft can be decelerated to the computed approach speed.

Note: The VFE NEXT displayed on the PFD takes into account the abnormal slats/flaps configuration.

L1
- **WHEN SPEED BELOW VFE**
  FLAPS lever .... RECYCLE

L3 *For recycling, set the FLAPS lever to 0. Then, immediately set the FLAPS lever to the position at the time the failure occurred.*
In the case of high friction or a jam (e.g. ice accretion), the movement of the slaps is automatically stopped to prevent overload. Recycling the FLAPS lever restores the movement of the slaps if the reason for the overload is no longer present

L1
- **If the slats are in CONF 2 or lower:**
  [MFD SURV] TAWS FLAP MODE .... OFF

[QRH] FIRE SMOKE / FUMES

Applicable to: ALL

Ident.: PRO-ABN-FIRE-QRH20-00020379.0001001 / 15 APR 19

L2 PURPOSE OF THE QRH SMOKE / FUMES PROCEDURE

The QRH SMOKE / FUMES procedure includes the following steps:
- Immediate actions

  The following ECAM procedures include the same immediate actions and then ask the flight crew to apply the QRH SMOKE / FUMES procedure:
  - SMOKE L(R) AVNCS SMOKE (*Refer to procedure*)
  - FIRE SMOKE / FUMES ABN not-sensed procedure (*Refer to procedure*).
- Rapid solution and/or diversion
- Investigate the source of smoke.

WHEN TO APPLY THE QRH SMOKE / FUMES PROCEDURE?

Apply the QRH procedure when :
- Requested by an ECAM procedure, or
- The flight crew or the cabin crew suspect that smoke is coming from the avionics, or the air conditioning, or the cabin equipment, or
- There is a smell of smoke:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

In the case of the ECAM triggers any other smoke alert (e.g. SMOKE FWD CARGO SMOKE):
- The flight crew must first apply the associated ECAM procedure
- Then, the flight crew can consider applying the QRH procedure because detected smoke alerts may be due to another source of smoke.

Continued on the following page

[QRH] FIRE SMOKE / FUMES (Cont'd)

Ident.: PRO-ABN-FIRE-QRH20-00016192.0006001 / 15 APR 19

L2 The following actions are the immediate actions.

These actions are also included in:
- The FIRE SMOKE/FUMES ABN not-sensed procedure
- The SMOKE L(R) AVNCS SMOKE ECAM procedure.

L1 **LAND ASAP**

APPLY IMMEDIATELY
- CREW OXY MASKS (if required)........................ USE/100%/EMER

L2 *Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.*

L1 - CAB FANS.. OFF

L2 *This action prevents smoke from moving from an area to another one, via the mixer unit (e.g. air from below cabin to cockpit)*

L1 - VENT AVNCS EXTRACT.. OVRD

L2 *The overboard valve partly opens together with the inboard valve in order to evacuate the air from the avionics to the outside air and to the bilge area of the aircraft.*

[QRH] FIRE SMOKE / FIRE FROM LITHIUM BATTERY

Applicable to: ALL

Ident.: PRO-ABN-FIRE-QRH26-00022542.0001001 / 15 APR 19

L2 Lithium batteries can be found in several devices such as:
- Laptops (including EFBs)
- Flashlights
- Tablets
- Phones.

L1 If necessary, transfer control to the flight crewmember seated on the opposite side of the fire.

CKPT / CABIN COM..ESTABLISH
STORAGE AFTER Li BAT FIRE cabin procedure..REQUEST INITIATION

L2 *The cabin crew initiates the STORAGE PROCEDURE AFTER LITHIUM BATTERY FIRE.*
For more information on the STORAGE PROCEDURE AFTER LITHIUM BATTERY FIRE, Refer to CCOM/CCOM procedure.

L1 ● **If flames:**

CREW OXY MASK (PF)..USE
PBE (PM)..USE

L2 *The PM uses the Protective Breathing Equipment (PBE).*

L1 FIRE EXTINGUISHER (PM)..USE

● **If no flames or when flames extinguished:**

■ **If not possible to remove device from cockpit:**

WATER or NON-ALCOHOLIC LIQUID..POUR ON DEVICE
DEVICE..MONITOR

■ **If possible to remove device from cockpit:**

DEVICE..TRANSFER TO CABIN

● **At ANY TIME of the procedure, if SMOKE becomes the GREATEST THREAT:**

L2 The following actions will reduce the quantity of smoke in the cockpit.

L1 CAB FANS..OFF
VENT AVNCS EXTRACT..OVRD
AIR FLOW..HI
CARGO FWD ISOL VALVES ◁ ....OFF

Continued on the following page

[QRH] FIRE SMOKE / FIRE FROM LITHIUM BATTERY (Cont'd)

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**

  IMMEDIATE LANDING...CONSIDER

  L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc...*

Intentionally left blank

[ABN] FUEL LEAK

Applicable to: ALL

Ident.: PRO-ABN-FUEL-9028W100-00014891.0001001 / 03 DEC 15

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the LEAK procedure, in the FUEL section.
This procedure must be applied if the sum of the FOB and the fuel used is abnormally less than the block fuel.
For more information about the fuel leak detection, *Refer to FCTM/PR-AEP-FUEL Fuel Leak*.

Indications:

SD page

FUEL SD Page

Continued on the following page

Ident.: PRO-ABN-FUEL-9028W100-00014893.0004001 / 03 JAN 20

LAND ANSA

L2 To identify the source of the fuel leak, the flight crew must stop all fuel transfers, and isolate each tank. Therefore, each wing tank feeds the associated engine.

L1 CROSSFEED A....................OFF
CROSSFEED B....................OFF
CTR TK L PMP....................OFF
CTR TK R PMP....................OFF
APU MASTER SW....................OFF
ALL TKS QTY....................MONITOR

- **FUEL QTY :**

  L2 The flight crew may suspect a leak in left(right) wing tank, if the fuel quantity in a wing tank decreases faster than the fuel quantity in the other wing tank.
  If the fuel quantity similarly decreases between the wing tanks, and the fuel quantity in the CTR TK decreases, the flight crew may suspect a fuel leak from the CTR TK.

  L1 ■ **DECREASES FASTER IN L TK**

  L2 As the fuel quantity decreases faster in the L TK, a fuel leak is suspected from the L TK or the ENG 1.
  To identify if the leak is due to the engine fuel system, the flight crew must shut down the associated engine.

  L1 APU....................AS RQRD
  THR LEVER 1....................IDLE
  ENG 1 MASTER....................OFF
  L TK QTY....................MONITOR

  - **L TK QTY STILL DECREASES ?**

    ■ **YES**

    L2 As the fuel quantity still decreases after the engine shut down, this confirms fuel leak comes from the L TK.
    The flight crew can restart the engine.

    L1 LEAK FROM L TK

    L TK FUEL MAYBE LOST

Continued on the following page

[ABN] FUEL LEAK (Cont'd)

FUEL LEAK SUSPECTED

Applicable to: ALL

Ident.: PRO-ABN-FUEL-2842W010-00004663.0001001 / 07 NOV 16

ANNUNCIATIONS

Triggering Conditions:

L2 The difference between FU and FOB is more than the leak detection threshold (2 500 kg to 4 000 kg (5 500 lb to 8 800 lb) depending of initial FOB. For more information on the fuel leak detection logic, *Refer to DSC-28-40 Fuel System Leak Detection*.
The flight crew could detect the fuel leak before the ECAM caution is triggered (e.g. visual detection or periodic fuel check). To display the associated not-sensed procedure, the flight crew must press the ABN pb on the ECP, and then select the FUEL LEAK procedure, in the FUEL section. For more information on the FUEL LEAK procedure, *Refer to PRO-ABN-FUEL [ABN] FUEL LEAK*.
For more information about the fuel leak detection, *Refer to FCTM/PR-AEP-FUEL Fuel Leak*.

LAND ANSA

ALL TKS QTY & FOB & FU....................CHECK

- **FOB + FU / BLOCK DISAGREE ?**
  - **YES**

    L2 To identify the source of the fuel leak, the flight crew must stop all fuel transfers, and isolate each tank. Therefore, each wing tank feeds the associated engine.

    L1 CROSSFEED A....................OFF
    CROSSFEED B....................OFF
    CTR TK L PMP....................OFF
    CTR TK R PMP....................OFF

    - **If both engines are running when the alert is triggered:**
      APU MASTER SW....................OFF

    ALL TKS QTY....................MONITOR

    - **If both engines are running when the alert is triggered:**
      - **FUEL QTY :**

        L2 The flight crew may suspect a leak in left(right) wing tanks, if the fuel quantity in a wing tank decreases faster than the fuel quantity in the other wing tank.
        If the fuel quantity similarly decreases between the wing tanks, and the fuel quantity in the CTR TK decreases, the flight crew may suspect a fuel leak from the CTR TK.

        L1
        - ■ **DECREASES FASTER IN L TK...**

          L2 As the fuel quantity decreases faster in the L TK, a fuel leak is suspected from the L TK or the ENG 1.
          To identify if the leak is due to the engine fuel system, the flight crew must shut down the associated engine.

          L1 APU....................AS RQRD
          THR LEVER 1....................IDLE
          ENG 1 MASTER....................OFF
          L TK QTY....................MONITOR

Continued on the following page

FUEL LEAK SUSPECTED (Cont'd)

- **L TK QTY STILL DECREASES ?**
  - **YES**

    L2 As the fuel quantity still decreases after the engine shut down, this confirms fuel leak comes from the L TK.
    The flight crew can restart the engine.

    L1 LEAK FROM L TK

    L TK FUEL MAYBE LOST

    - **FOR ENG 1 RELIGHT**

      ENG RELIGHT IN FLT PROC............. *REFER TO PROC APPLY*

      L2 *The ECAM displays the complete ENG RELIGHT IN FLT abnormal not sensed procedure.*

    L1 WINGS : DO NOT BALANCE

    L2 *Do not balance wings, to not feed the fuel leak. Expect a FUEL L WING TK LEVEL LO (Refer to procedure).*

  - L1 **NO**

    L2 As the leak stops after engine shutdown, this confirms that the fuel leak is in the engine fuel system.
    L3 The leak is downstream of the ENG 1 LP valve.
    L2 The engine must remain shutdown with the associated LP valve closed.

    L1 LEAK FROM ENG 1

    ENG 1 MASTER : KEEP OFF
    CTR TK L PMP.. ON
    CTR TK R PMP.. ON

  REVERSERS : DO NOT USE

  BTV : DO NOT USE

- **DECREASES FASTER IN R TK...**

  L2 As the fuel quantity decreases faster in the R TK, a fuel leak is suspected from the R TK or the ENG 2.
  To identify if the leak is due to the engine fuel system, the flight crew must shut down the associated engine.

  L1 APU... AS RQRD

FWS FWS 1+2 FAULT (Cont'd)

Ident.: PRO-ABN-FWS-31CDSMSG1-00017609.0001001 / 30 JUN 14

L2 Note: *If the FWS FWS 1+2 FAULT alert is triggered, while neither the FWS FWS 1 FAULT alert nor the FWS FWS 2 FAULT alert was previously triggered, the FWS FWS 1+2 FAULT alert may be due to a spurious failure of the CDS display. In the case of a spurious failure of the CDS display, the ECAM may still be available (normal checklist, audio indicators, master caution, master warning, memos and limitations on the PFD, and automatic display of SD pages are still available), but the ECAM can no longer display any subsequent alerts and procedures on the WD. The spurious failure of the CDS display may be due to the Display Unit (DU). Therefore, ECAM display may recover, if the flight crew resets the CENTER UPPER DU (OFF during 5 s, then ON), or the flight crew performs a DU reconfiguration in order to display the WD on another DU.*

During descent and approach preparation, the flight crew must regularly check the general status of all aircraft systems on:
- The overhead panel
- The available SD pages.

The flight crew should use the FCOM on the OIS to display any necessary procedures.
In the case of failure of both FWS, the aircraft approach and landing capability is limited to APPR1.

Continued on the following page

FWS FWS 1+2 & CPIOM FAULT

Applicable to: ALL

Ident.: PRO-ABN-FWS-31CDSMSG2-00003207.0001001 / 30 JUN 14

ANNUNCIATIONS

Triggering Conditions:

L2 Both FWS 1 and FWS 2 are failed, and one or more CPIOMs of the following CPIOM groups are failed:

- CPIOM group H3, or
- CPIOM group H4, or
- CPIOM group H6, or
- CPIOM group J2, or
- CPIOM group J5, or
- CPIOM group J7.

For more information about the CPIOM groups, *Refer to DSC-42-10 CPIOM*.

L3 The CDS, instead of the FWS, displays the FWS FWS 1+2 & CPIOM FAULT alert.

Other Inhibition:

L2 The FWS FWS 1+2 & CPIOM FAULT alert is displayed on ground, if the aircraft speed is less than 50 kt.

Continued on the following page

FWS FWS 1+2 & CPIOM FAULT (Cont'd)

Ident.: PRO-ABN-FWS-31CDSMSG2-00007623.0004001 / 26 JUL 17

L2 Note: *If the FWS FWS 1+2 & CPIOM FAULT is triggered, and neither the FWS FWS 1 FAULT alert nor the FWS FWS 2 FAULT alert was previously triggered, the FWS FWS 1+2 & CPIOM FAULT alert may be due to a spurious failure of the CDS display. In the case of a spurious failure of the CDS display, the ECAM may still be available (audio indicators, master caution, master warning, memos and limitations on the PFD, and automatic display of SD pages are still available), but can no longer display any subsequent alerts and associated procedures on the WD. The spurious failure of the CDS display may be due to the Display Unit (DU). Therefore, the flight crew may recover all ECAM functions, if the flight crew resets the CENTER UPPER DU (OFF for 5 s, then ON), or if the flight crew performs a DU reconfiguration to display the WD on another DU.*

Due to the fact that FWS 1 and FWS 2 are failed:
- The ECAM will no longer trigger alerts and dispatch messages, audio indicators will no longer sound, and the MASTER lights will no longer come on
- The flight crew can no longer display the normal checklists
- The approach and landing capability is limited to APPR1.

During descent and approach preparation, the flight crew must regularly check the general status of all aircraft systems on:
- The overhead panel
- The available SD pages.

The flight crew should use the FCOM on the OIS to display any necessary procedures.

Note: *FWS 1 and FWS 2 are failed. As a result, the FWS is not able to manage the space between the lines of text of the FWS FWS 1+2 & CPIOM FAULT procedure. Each line of text of the procedure is assigned to an action or information that results from the failure of a specific CPIOM. A line of text appears, only if this line of text is related to the failed CPIOM. The space between two displayed lines of text corresponds to the lines of text that are not displayed, because these lines of text are related to the CPIOMs that are not failed.*
The following illustration illustrates the entire alert display, in the case of the failure of CPIOM group J1 combined with all other CPIOM groups.

FWS FWS 1+2 & CPIOM FAULT (Cont'd)

Ident.: PRO-ABN-FWS-31CDSMSG2-00007624.0003001 / 26 JUL 17

- **If CPIOMs (H31 or H33) and (H32 or H34) are failed:**
  CTR TK FEED..MAN

ECAM SD & OVHD PNL..MONITOR

L2 *The SD pages are no longer available for the systems that the failed CPIOM group hosts. In addition, the failure of the CPIOM group can affect the information displayed on the SD pages of other systems.*
Regularly check the overhead panel for local warnings, and the SD pages for system checks.

L1
- **If CPIOMs (H43 and H44) are failed:**
  AVOID ICING CONDITIONS

L2 *The wing anti-ice is failed.*

L1
- **If CPIOM J51 is failed:**
  ATC COM VOICE ONLY

L2 *All ATC datalink applications (ADS, CPDLC, digital ATIS, etc.) are failed.*

L1
- **If CPIOMs H41 and H42 are failed:**
  CABIN ALT MODE..MAN

L2 *The automatic control mode of the cabin pressurization system is failed.*

L1 WHEN ACFT FL>250 : CAB ALT TRGT..7000FT
WHEN ACFT FL<250 : CAB ALT TRGT..LDG ELEVN

- **If CPIOMs (H61 or H63) and (H62 or H64) are failed:**
  L/G GRVTY EXTN ONLY (MAX SPEED 220 KT)

L2 *The following systems and functions are failed:*
- *Autobrake*
- *Steering*
- *Normal landing gear extension/retraction.*
  As a result, the landing gear extension is available by gravity only. Use the L/G GRVTY EXTN sw to extend the landing gear by gravity. *Refer to deferred proc.*

L1 FUNCTIONS NOT AVAIL :
RNP AR CAPABILITY

- **If CPIOMs (H31 or H33) and (H32 or H34) are failed:**
  FQMS 1+2 / JETTISON

Continued on the following page

FWS FWS 1+2 & CPIOM FAULT (Cont'd)

L2 *JETTISON is only displayed if jettison is installed.*

L1
- **If CPIOMs (H41 and H42) are failed:**
  VENT CTL / TEMP CTL

L2 *Temperature regulation in the cabin is degraded. The temperature in some zones can be abnormally low.*

L1
- **If CPIOMs (H43 and H44) are failed:**
  WING A-ICE

L2 *Wing anti-ice is failed. Therefore, avoid icing conditions.*

L1
- **If CPIOMs group (H61 or H63) and (H62 or H64) are failed:**
  L/G CTL 1+2 / N/W STEER / AUTO BRK

L2 *The emergency braking mode is active, and the landing distance is increased. Refer to the performance module.*
For landing, use the rudder, the differential braking, or both the rudder and the differential braking to steer the aircraft on the runway, because the nose landing gear turns freely.
After landing, the aircraft must be towed off the runway.

L1
- **If CPIOMs J21 and J23 (or J22 and J24) are failed:**
  ENG 1(2) REVERSER / ENG A-ICE CTL
- **If CPIOMs (J21 and J23) and (J22 and J24) are failed:**
  ENG 1+2 REVERSERS / ENG A-ICE CTL

ECAM WARNINGS & CAUTIONS / ABN PROCEDURES
LIMITATIONS & STATUS / DISPATCH / DEFERRED
ALT ALERT & AUTO CALLOUT / NORM C/L & MEMOS

- **If CPIOMs (J71 and J72) are failed:**

HYD G(Y) SYS MONITORING FAULT (Cont'd)

Ident.: PRO-ABN-HYD-2910W220-00012208.0001001 / 02 OCT 14

Note: If the failure is only due to an IMA module failure, the ECAM displays the DUE TO IMA MODULE FAULT subtitle.

L2 If both HMCAs or two HMCRFs of the green(yellow) hydraulic system fail:

- The hydraulic system continues to operate.
- Most of the indications on the HYD SD page are lost.
- System overheat detection is still available.
- System pressure, reservoir pressure, and pumps pressure remain monitored, and the associated ECAM alerts can trigger if necessary except if SYS pressure transducers, RSVR temperature transducers or EDP pressure transducers are inoperative.
- The automatic electric pumps operations are lost (Cargo doors and brake accumulators reinflation). The cargo doors must be operated manually.

For more information: *Refer to DSC-29-10 Hydraulic Monitoring and Control (HMC)*

L2 *Note:*
1. *On the WHEEL SD page, a time indication for the loss of the A-SKID is displayed. This time indication may be erroneous (underestimated) during initial climb up to the first hour of cruise in the case of hydraulic failure. Disregard "TIME TO A-SKID LOSS INFO" during initial climb and the first hour of cruise.*
2. *After landing gear extension, NORM indication may be displayed in the box on the WHEEL SD page. Disregard NORM indication on the WHEEL SD page if the alert is triggered after landing gear extension.*

In the case of a green (yellow) hydraulic system failure:
- The flight controls are actuated by the remaining hydraulic system, or by the Electrical-Hydrostatic Actuators (EHA) and the Electrical Backup Hydraulic Actuators (EBHA)
- The flaps operate at half-speed.
- The slats operate at half-speed if the yellow hydraulic system is failed.
- The Nose Wheel Steering (NWS) is lost if the yellow hydraulic system is failed.
- The BTV function is lost but the autobrake function is still available.
- The display of the Runway Overrun Warning / Runway Overrun Protection (ROW/ROP) bars is lost but the warnings (PFD and audio) remain available.
- The normal braking is partially lost, but the affected brakes are reconfigured in alternate braking mode.
- The antiskid is available including brakes that are reconfigured in alternate mode.
- If the failure of the green (yellow) hydraulic system occurs before landing gear retraction:
  - When commanded, the Main Landing Gear (MLG) retracts, if the yellow hydraulic system is failed
  - When commanded, the Nose Landing Gear (NLG) retracts, if the green hydraulic system is failed.
- Landing gear extension is performed by gravity.

L2 *Note:*

1. *On the WHEEL SD page, a time indication for the loss of the A-SKID is displayed. This time indication may be erroneous (underestimated) during initial climb up to the first hour of cruise in the case of hydraulic failure. Disregard "TIME TO A-SKID LOSS INFO" during initial climb and the first hour of cruise.*
2. *After landing gear extension, NORM indication may be displayed in the box on the WHEEL SD page. Disregard NORM indication on the WHEEL SD page if the alert is triggered after landing gear extension.*

In the case of a green (yellow) hydraulic system failure:

- The flight controls are actuated by the remaining hydraulic system, or by the Electrical-Hydrostatic Actuators (EHA) and the Electrical Backup Hydraulic Actuators (EBHA)
- The flaps operate at half-speed.
- The slats operate at half-speed if the yellow hydraulic system is failed.
- The Nose Wheel Steering (NWS) is lost if the yellow hydraulic system is failed.
- The BTV function is lost but the autobrake function is still available.
- The display of the Runway Overrun Warning / Runway Overrun Protection (ROW/ROP) bars is lost but the warnings (PFD and audio) remain available.
- The normal braking is partially lost, but the affected brakes are reconfigured in alternate braking mode.
- The antiskid is available including brakes that are reconfigured in alternate mode.
- If the failure of the green (yellow) hydraulic system occurs before landing gear retraction:
  - When commanded, the Main Landing Gear (MLG) retracts, if the yellow hydraulic system is failed
  - When commanded, the Nose Landing Gear (NLG) retracts, if the green hydraulic system is failed.
- Landing gear extension is performed by gravity.

L2 In the case of green and yellow hydraulic systems failure:
- The flight controls revert to alternate law.
  The autopilot remains available.
  The flight control surfaces are actuated by the Electrical-Hydrostatic Actuators (EHA) and the Electrical Backup Hydraulic Actuators (EBHA).
- The inner flaps are inoperative and the outer flaps are slow.
  The slats are slow.
  The Primary Flight Display (PFD) displays the Maximum Flap Extended Speed (VFE) and the Lowest Selectable Speed (VLS) that corresponds to the current abnormal slats/flaps configuration.
- No autoland.
  If the configuration is set to CONF 3 or CONF FULL before the failure, the autoland remains available.
- Landing gear extension is performed by gravity.
- Normal braking is lost.
- Nose Wheel Steering (NWS) is lost.
- Alternate braking with anti-skid is available.
- Brake To Vacate (BTV) function is lost, but autobrake (A/BRK) mode remains available.
  Runway end Overrun Warning / Runway end Overrun Protection (ROW/ROP) bars display are lost but warnings (PFD and audio) remain active.

> FOR APPROACH (HYD G+Y SYS PRESS LO)

USE SELECTED SPEED

Continued on the following page

HYD G+Y SYS PRESS LO (Cont'd)

To prepare the aircraft for landing, the managed speed is not adapted in the case of abnormal slats/flaps configuration. Therefore, the flight crew must use the selected speed to decelerate the aircraft to the approach speed, as follows:

- *Decelerate the aircraft toward the VFE NEXT-5 kt. In the case of turbulence, to avoid VFE exceedance, the flight crew may decide to decelerate to a lower speed but above the VLS.*
- *When the aircraft reaches the selected speed, the FLAPS lever can be set one step down.*

The above steps are repeated until the FLAPS lever is set to 3.
When the landing configuration is established, aircraft can be decelerated to the computed approach speed.

Note: The VFE NEXT displayed on the PFD takes into account the abnormal slats/flaps configuration.

FOR VFE: USE PFD

The ECAM and the PFD speed scale display the VFE that is associated with the current abnormal configuration. For more information, Refer to DSC-27-20-20 Configurations.

[ABN] MISC BOMB ON BOARD

Applicable to: ALL

Ident.: PRO-ABN-MISC-9090W180-00015854.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the BOMB ON BOARD procedure in the MISCELLANEOUS section.

L3 The flight crew must apply this procedure if a bomb is discovered.

Ident.: PRO-ABN-MISC-9090W180-00005189.0001001 / 07 NOV 16

L2 To avoid the activation of an altitude-sensitive bomb, the cabin altitude should not exceed the value at which the bomb is discovered.
To reduce the effects of the explosion, the aircraft should fly as long as possible with approximately 1 PSI differential pressure, to help the blast to go outwards. 1 PSI differential pressure corresponds to a 2 500 ft difference between the aircraft and the cabin altitude. The flight crew sets and maintains the differential pressure with the manual pressure control.
This procedure is considered to be applicable during climb or cruise. However, if flight conditions are different, the crew should adapt the procedure in accordance with the above-mentioned principles.
This procedure is related to flight crew actions. For cabin related procedure, *Refer to CCOM/14-90 Bomb On Board*.

Continued on the following page

FMS PRED UNRELIABLE WITHOUT ACCURATE FMS FUEL PENALTY INSERTION

The fuel consumption is increased. The FUEL PENALTY on the FMS DATA/STATUS page may be updated.

For fuel penalty determination, Refer to PER-IFT-FP Fuel Penalty Tables - Fuel Consumption Increased.

[ABN] MISC CIRCLING APPROACH WITH ONE ENG INOP

Applicable to: ALL

Ident.: PRO-ABN-MISC-9090W210-00018982.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the CIRCLING APPROACH WITH ONE ENG INOP procedure in the MISCELLANEOUS section.

Ident.: PRO-ABN-MISC-9090W210-00020265.0001001 / 12 NOV 14

LDG WEIGHT.. CHECK
[QRH] CIRCLING APPROACH PROC.. *REFER TO (PROC APPLY)*

L2 *Refer to the CIRCLING APPROACH WITH ONE ENGINE INOPERATIVE QRH procedure to check whether the landing weight is below the maximum weight for circling approach in CONF 3 with LDG GEAR DOWN.*

[ABN] MISC CKPT WINDOW CRACKED

Applicable to: ALL

Ident.: PRO-ABN-MISC-9090W160-00015855.0001001 / 04 MAY 16

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the CKPT WINDOW CRACKED procedure in the MISCELLANEOUS section.

L3 The flight crew must apply this procedure when cracks are detected on a cockpit window.

Ident.: PRO-ABN-MISC-9090W160-00005190.0002001 / 13 MAR 19

L2 When a windshield or a lateral window is cracked, the flight crew must determine which layer is cracked (*Refer to DSC-56-10 Cockpit Windshields and Windows*).

L1 Touch the cracks with a pen (or carefully with fingernail) to determine if there is a crack on the cockpit side.

Continued on the following page

[ABN] MISC CKPT WINDOW CRACKED (Cont'd)

1 CREW SHOULDER HARNESSES....................FASTEN

- **CRACK(S) ON COCKPIT SIDE ?**
  - **YES...**

L2 The internal cockpit side layer is affected. At least one structural layer is broken. The flight crew is not able to accurately determine if the internal middle structural layer is also cracked. Therefore, the flight crew must reduce differential pressure to 5 PSI.

L1 CREW OXY MASKS....................USE

MAX FL : 230/MEA-MORA

L2 *Reducing the flight level to FL 230 will enable the flight crew to obtain a differential pressure of 5 PSI. This reduction will also help to avoid excessive cabin altitude, and the triggering of the CAB PRESS EXCESS CAB ALT alert.*

L1 MAX DIFF PRESS : 5 PSI

CABIN ALT MODE....................MAN

ACFT CRZ FL	CABIN ALT TRGT
230	8000
200	6000
150	3000
100	LDG ELEVN

CABIN ALT TRGT....................AS RQRD

Set the cabin altitude target, in accordance with the above table, to maintain a differential pressure of 5 PSI.

  - **NO...**

L2 The internal cockpit side layer is not affected. At least one structural layer remains intact, therefore the integrity of the structure is not affected. The flight can be continued. Windshield or window arcing is not likely to occur.

L1 STRUCTURE NOT AFFECTED

NO LIMITATION

L2 To avoid windshield or window arcing, turn off the heating:

[ABN] MISC DITCHING

Applicable to: ALL

Ident.: PRO-ABN-MISC-9090W130-00015857.0001001 / 08 JUL 19

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the DITCHING procedure.
If both engines are detected failed by the FWS, the ECAM displays the ENG ALL ENGINES FAILURE alert and the flight crew should apply the associated procedure, that includes the DITCHING procedure.

Ident.: PRO-ABN-MISC-9090W130-00008676.0001001 / 07 JUL 16

The direction of ditching depends mainly on wind direction and sea state and these factors may be considered as follows:

1. Wind direction:
   This may be determined by observation of the waves, which move and break downwind. Spray from wave tops is also a reliable indicator.
2. Wind speed:

   The following guidelines can be used to evaluate wind speed:
   - A few white crests: 8 kt-17 kt
   - Many white crests: 17 kt-26 kt
   - Streaks of foam along water: 23 kt-35 kt
   - Spray from waves: 35 kt-43 kt.

3. Sea state:
   This is best determined from a height of 500 ft to 1 000 ft. At lower height, the direction of the swell may be less obvious than the direction of the waves, even though the waves are much smaller.
   When there is no swell, align into the wind.
   In the presence of swell, and provided that drift does not exceed 10 °, ditch parallel to the swell and as nearly into the wind as possible. If drift exceeds 10 °, ditch into wind. The presence of drift on touchdown is not dangerous, but every effort should be made to minimize roll.
   Touchdown with approximately 7.5 ° of pitch and minimum vertical speed.

[ABN] MISC OVERWEIGHT LDG

Applicable to: ALL

Ident.: PRO-ABN-MISC-9090W150-00015860.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the MISC OVERWEIGHT LDG procedure in the MISCELLANEOUS section.

L3 The flight crew must apply this procedure when the aircraft must land above the Maximum Landing Weight (MLW).

Ident.: PRO-ABN-MISC-9090W150-00005196.0001001 / 06 NOV 14

L2 Automatic landing is certified up to the Maximum Landing Weight (MLW). Autoland flight tests have, however, been successful up to the Maximum Takeoff Weight (MTOW).
Depending on the situation (e.g emergency or other) and provided that the runway is approved for automatic landing, the flight crew can decide to perform an autoland up to the maximum takeoff weight.

Continued on the following page

[ABN] MISC OVERWEIGHT LDG **(Cont'd)**

Ident.: PRO-ABN-MISC-9090W150-00008684.0001001 / 08 JUL 19

JETTISON PROC ◁✻ .... CONSIDER

LDG DIST AFFECTED

- **If another failure affects VAPP:**

  LDG PERF AFFECTED

  Use the ECAM flap setting, if required for abnormal operations. In all other cases:
  - *FULL is preferred for optimized landing performance*
  - *If the aircraft weight is above one of the limiting weight for go-around use FLAP 3 for landing.*

- **FOR APPROACH:**

  PACK 1+2.. OFF OR ON APU BLEED

  L2 *The selection of the PACKS to OFF (or to APU BLEED) increases the maximum thrust available from the engines, in the case of a go-around.*

  L1 If LDG CONF 3: USE CONF 1 FOR GO AROUND

  SPEED AT RUNWAY THRESHOLD : VLS

  L2 *This speed target is applicable in manual landing and autoland. Reduce the speed to reach VLS at the runway threshold. Touch down as smoothly as possible to reduce the V/S. The maximum touchdown V/S should not exceed 360 ft/min. The main landing gears must touch down as symmetrically as possible.*

  Note: The VLS that is displayed on the PFD takes into account the actual aircraft configuration, even with slats or flaps, locked or failed.
  However, this line can be inhibited if another failure affects the landing performances with a VAPP increment. In that case the flight crew must follow the VAPP that the ECAM requires.

L1
- **FOR LANDING:**

  INCREASE FLARE HEIGHT

  USE MAX REVERSE ASAP

  L2 *It is recommended to use the reverse as soon as possible, in order to limit the braking action.*

  L1 APPLY BRAKES AS NECESSARY

  L2 *It is recommended that the flight crew uses the maximum available runway length to limit the braking energy.*
  It is recommended to use the BTV function, and set the runway end as the BTV exit in order to optimize the braking and to minimize the braking energy.

[MEM] STALL RECOVERY

Ident.: PRO-ABN-MISC-00017698.0001001 / 06 NOV 14
Applicable to: ALL

As soon as any stall indication (could be aural warning, buffet, etc.) is recognized, apply the immediate actions.

NOSE DOWN PITCH CONTROL.. APPLY

This will reduce angle of attack.

Note: In the case of lack of pitch down authority, reducing thrust may be necessary.

BANK.. WINGS LEVEL

- **When out of stall (no longer stall indications):**

  THRUST.. INCREASE SMOOTHLY AS NEEDED

  Note: In the case of one engine inoperative progressively compensate the thrust asymmetry with rudder.

  SPEEDBRAKES.. CHECK RETRACTED
  FLIGHT PATH.. RECOVER SMOOTHLY

  - **If in clean configuration and below 20 000 ft:**

    FLAP 1.. SELECT

  Note: If a risk of ground contact exists, once clearly out of stall (no longer stall indications), establish smoothly a positive climb gradient.

[QRH] EMER LANDING
ALL ENG FAILURE

Ident.: PRO-ABN-MISC-00020851.0001001 / 14 MAR 18
Applicable to: ALL

Apply the following if not able to maintain altitude after the loss of thrust near the ground.

■ For anticipated Ditching

APU.......................................START

L2 *If the ENG ALL ENGINES FAILURE alert is triggered, the RAT automatically extends, and the APU automatically starts.*
If the ENG ALL ENGINES FAILURE alert is not detected, the flight crew starts the APU.

L1 FLAPS.......................................AT LEAST CONF 2

L2 *The flaps extension to the FLAPS 2 position requires 3 min (A350-900) and 4 min (A350-1000).*
If the FLAPS position is above FLAPS 2, the flight crew should keep current FLAPS setting.
If the flaps are retracted, and if required, the flight crew can extend FLAPS to more than 2.
However, due to the slow flap extension, the selected flaps configuration may not be reached.

L1 L/G.......................................KEEP UP
MIN APPROACH SPEED.......................................VLS+15 kt
CABIN CREW.......................................ADVISE
DITCHING P/B.......................................ON

L2 *All the valves of the pressurization system that are below the flotation line close.*
Additionally, when the DITCHING pb-sw is pressed, the VLS also decrease below 1 000 ft.

L1 [MFD SURV] GPWS/TERR (if avail).......................................OFF

L2 *The flight crew sets the GPWS button and the TERR button to off on the SURV page of the MFD in order to avoid a permanent audio warning/caution.*
Depending on the electric supply, the SURV page may not be available.

L1 ● **At 500 ft AGL or below:**

BRACE FOR IMPACT.......................................ORDER
VAPP : VLS+15 kt.......................................ADJUST

L2 *Below 500 ft and DITCHING pb-sw pressed, the VLS decreases and the flight crew must adjust the VAPP for touchdown.*

L1 ● **For flare:**

INCREASE FLARE HEIGHT

OPTIMUM PITCH ATT: 7.5 ° (MAX 9 °)

TOUCHDOWN AT MIN V/S

[ABN] NAV IR ALIGNMENT IN ATT MODE

Applicable to: ALL

Ident.: PRO-ABN-NAV-9034W100-00015863.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the IR ALIGNMENT IN ATT MODE in the NAV section.

Ident.: PRO-ABN-NAV-9034W100-00004543.0001001 / 06 NOV 14

L2 If IR alignment is lost in flight, the navigation mode of affected IR is inoperative. However, the CDS automatically reconfigures to use an operative IR.
If the navigation mode of all IRs is inoperative, the heading is inoperative (HDG flag appears on the PFD and on the ND). For attitude, the PFDs automatically reconfigure to use the ISIS attitude (for more information, *Refer to DSC-34-NAV-20-30 Display of ISIS Inertial Data*).
Aircraft attitude and heading for affected IR can be recovered with the following procedure.

During the procedure, the flight crew must ensure that:
- The wings are level
- The speed is constant.

Ident.: PRO-ABN-NAV-9034W100-00008330.0002001 / 03 JUL 20

1 IR MODE SEL (AFFECTED)..ATT
SPEED, HDG & FL : KEEP CONST FOR 30 S

DEACTIVATE

[ABN] NAV UNRELIABLE AIR SPEED INDICATION

Applicable to: ALL

Ident.: PRO-ABN-NAV-9027W140-00019126.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the UNRELIABLE AIR SPEED INDICATION in the NAV section.

Continued on the following page

[ABN] NAV UNRELIABLE AIR SPEED INDICATION **(Cont'd)**

AP.......................................OFF
A/THR.......................................OFF
FD.......................................OFF

L2 *The flight crew considers the ADR speeds unreliable. As a consequence, they must not use the AP/FD and A/THR.*

L1 AIR DATA SWTG ON PF SIDE.......................................BKUP

L2 *The PFD on the PF side displays the backup speed and backup altitude. The backup air data is reliable.*

L3 *For more information on the display of backup indications, Refer to DSC-34-NAV-20-30 Backup Speed and Backup Altitude Indications.*

L2 *The air data displayed on the PM side remains based on the ADRs. As a consequence, the PM should consider the air data displayed on its PFD as unreliable.*

L1 MIN N1 (ALL ENGs)....................................... 40 %

L2 *The backup speed is displayed on PF side with the AIR DATA selector. When the ADRs are on and are not rejected by PRIMs, the backup speed is only based on FADECs data. The thrust must be above 40 % N1 to ensure the accuracy of the displayed backup speed.*

L1 ■ **If CAPT & F/O SPD DISAGREE (>30 KT):**

ADR 1+2+3 P/Bs ....OFF

L2 *The backup speed is reliable. The flight crew confirms that the ADRs are unreliable. Therefore, the flight crew must switch off the ADRs.*
The RVSM capability is lost (Refer to PRO-SPO-RVSM Required Equipment and Functions).

The PRIMs compare the ISIS air data and the backup air data:

- *If there are no differences, the CDS displays the backup air data on the PFD of the PF (as set with the AIR DATA selector) and the ISIS air data on the PFD of the PM. As a consequence, the alternate law is triggered. In this case, the OVERSPEED alert is not available.*
  For more information on the display of ISIS air data indications, Refer to DSC-34-NAV-20-30 Display of ISIS Speed and Altitude Indications.
- *In the case of differences, the PRIMs reject the ISIS air data and the CDS displays the backup air data on both PFDs. As a consequence, the direct law is triggered.*

L1 N1.......................................AS RQRD

L2 *When all ADRs are switched off , the backup speed is based on FADECs data at high speed but also on AOA probes at low speed. Therefore, the thrust can be set as required.*

[ABN] NAV UNRELIABLE AIR SPEED INDICATION **(Cont'd)**

L1 SPD & ALT...FLY THE BKUP

L2 *Even if the ISIS air data is displayed on one PFD, the PF should use the backup speed and altitude. Indeed, the backup air data is the source of air data which is the most independent from the ADRs (different technology compared to ISIS and ADIRS).*
A rapid change of thrust may disturb the backup speed computation. In this case, the backup speed indication fluctuates during a transient.

L1
- **If backup altitude (or speed) is displayed on at least one PFD:**
  BKUP SPD ACCURACY : 10 KT
  BKUP ALT ACCURACY : 500 FT

L2 *The speed and altitude accuracy is downgraded when the PFD displays the backup air data.*

L1
- **If the backup speed is only based on AOA probes and backup speed is displayed on at least one PFD:**
  MAX SPEED : 300/.80
  MAX FL : 300

L2 *Due to failures, the PRIMs cannot use the FADEC air data for computation of the backup speed. Therefore, the flight level and speed are limited to ensure the accuracy of the backup speed.*

NAV NOT ON FMS RUNWAY

Applicable to: ALL

Ident.: PRO-ABN-NAV-3438W100-00012619.0001001 / 03 DEC 15

ANNUNCIATIONS

Triggering Conditions:

L2 One thrust lever is set at or above the CLB detent and airport navigation function detects that the aircraft is not on the runway that is selected in the FMS.

The alert remains displayed:
- During 30 s after the flight crew retards the thrust levers below the CLB detent, or
- Until the aircraft becomes airborne.

L2 Expect the SMOKE warning to remain displayed during agent discharge. The smoke detectors are sensitive to both smoke and extinguishing agent. Once the bottles are fully discharged, the SMOKE warning remains displayed only if smoke particles are still detected.
Once isolation valves are closed, the cargo is no longer ventilated, and cargo temperature is no longer reliable.

[MEM] TAWS CAUTION

Applicable to: ALL

Ident.: PRO-ABN-SURV-MEM15-00007806.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 The TAWS detects potential hazardous situation with respect to surrounding terrain. For more information, *Refer to TAWS*.
For more information on the audio indicators, *Refer to DSC-34-SURV-20-20 Audio Indicators*.

Continued on the following page

[MEM] TAWS CAUTION (Cont'd)

Ident.: PRO-ABN-SURV-MEM15-00007808.0001001 / 05 NOV 18

■ "OBSTACLE AHEAD", "TERRAIN AHEAD", "TERRAIN TERRAIN" or "TOO LOW TERRAIN"

L2 For more information on "OBSTACLE AHEAD" and "TERRAIN AHEAD" alerts, *Refer to Terrain Function*.
For more information on "TERRAIN TERRAIN" alert, *Refer to GPWS mode 2*.
For more information on "TOO LOW TERRAIN" alert, *Refer to GPWS mode 4*.

L1 **■ During night or IMC conditions:**

Simultaneously:

AP...OFF
PITCH...PULL UP

Pull to full backstick and maintain in that position.

THRUST LEVERS...TOGA
SPEED BRAKES LEVER...CHECK RETRACTED
BANK...WINGS LEVEL or ADJUST

L2 Aircraft obtain the best climb performance when the wings are as level as possible. The flight crew can adjust bank while climbing, provided that turning is the safest action.

L1 *Note:* *For some airports, the operator may define a specific procedure.*

DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL CLEAR OF OBSTACLE.

■ During daylight and VMC conditions, with terrain and obstacles clearly in sight:

FLIGHT PATH...ADJUST

L2 Adjust pitch, bank and thrust to silence the alert.

L1 *Note:* *For some airports, the operator may define a specific procedure.*

■ "SINK RATE"

L2 For more information on "SINK RATE" alert, *Refer to GPWS mode 1*.

L1 **■ Above 1 000 ft AAL IMC or above 500 ft AAL VMC:**

FLIGHT PATH...ADJUST

L2 Adjust pitch and thrust to silence the alert.

Continued on the following page

[MEM] TAWS CAUTION (Cont'd)

L1

- ■ **Below 1 000 ft AAL IMC or below 500 ft AAL VMC:**

  GO AROUND.. CONSIDER

- ■ **"DON'T SINK"**

L2 For more information on "DON'T SINK" alert, *Refer to GPWS mode 3*.

L1 FLIGHT PATH.. ADJUST

L2 Adjust pitch and thrust to silence the alert.

L1
- ■ **"GLIDESLOPE"**

L2 For more information on "GLIDESLOPE" alert, *Refer to GPWS mode 5*.

L1
- ■ **Above 1 000 ft AAL IMC or above 500 ft AAL VMC:**

  FLIGHT PATH.. ADJUST

L2 Adjust pitch and thrust to reduce the vertical deviation from the glideslope.

L1
  - ● **If the flight crew intentionally flies below the glide slope:**

    G/S MODE.. OFF

- ■ **Below 1 000 ft AAL IMC or below 500 ft AAL VMC:**

  GO AROUND.. CONSIDER

- ■ **"TOO LOW GEAR" or "TOO LOW FLAPS"**

L2 For more information on "TOO LOW GEAR" and "TOO LOW FLAPS" alerts, *Refer to GPWS mode 4*.

L1 GO AROUND.. PERFORM

[MEM] TAWS WARNING

Applicable to: ALL

Ident.: PRO-ABN-SURV-MEM20-00007790.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 The TAWS detects:
- An excessive rate of descent at low altitude ("PULL UP"), or
- A terrain collision threat ahead of the aircraft ("TERRAIN AHEAD, PULL UP"), or
- An obstacle collision threat ahead of the aircraft ("OBSTACLE AHEAD, PULL UP").

For more information on the audio indicators, *Refer to DSC-34-SURV-20-20 Audio Indicators*.

Ident.: PRO-ABN-SURV-MEM20-00007800.0001001 / 05 NOV 18

● **"PULL UP" or "TERRAIN AHEAD PULL UP" or "OBSTACLE AHEAD PULL UP"**

Simultaneously:

AP..OFF
PITCH..PULL UP

Pull to full backstick and maintain in that position.

THRUST LEVERS..TOGA
SPEED BRAKES LEVER..CHECK RETRACTED
BANK..WINGS LEVEL or ADJUST

L2 Aircraft obtain the best climb performance when the wings are as level as possible. The flight crew can adjust bank while climbing, provided that turning is the safest action.

The “TERRAIN AHEAD, PULL UP” or the “OBSTACLE AHEAD, PULL UP” aural alert may be followed by the "AVOID TERRAIN" or "AVOID OBSTACLE" aural alert. In this case, the flight crew must adjust bank as necessary.

L1 DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL CLEAR OF OBSTACLE.

[MEM] TCAS CAUTION - TRAFFIC ADVISORY

Applicable to: ALL

Ident.: PRO-ABN-SURV-MEM30-00007794.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 The TCAS detects a Traffic Advisory (TA).

Indications:

Audio

For more information on the audio indicator, *Refer to DSC-34-SURV-40-20 Audio Indicators*.

Ident.: PRO-ABN-SURV-MEM30-00007809.0001001 / 06 NOV 14

L2 If the AP/FD TCAS mode is available, the TCAS mode arms on FMA.
For more information about AP/FD mode with traffic advisory, *Refer to DSC-22-FG-70-100-40 Introduction*.

L1 TCAS mode..CHECK ARMED

L2 If the AP/FD TCAS mode does not arm, the flight crew must be prepared to disconnect the AP in the case of a resolution advisory, and manually follow the TCAS guidances.

L1 ● **If the A/THR is off:**

AUTOTHRUST..RECOMMENDED

L2 *It is recommended to set the A/THR to ON with the thrust levers in CL detent, in order to avoid the AUTO FLT A/THR LIMITED alert at the automatic A/THR activation that occurs in the case of a resolution advisory.*

L1 Do not perform a maneuver based on a TA alone.

[MEM] TCAS WARNING - RESOLUTION ADVISORY

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

Ident.: PRO-ABN-SURV-MEM35-00021020.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

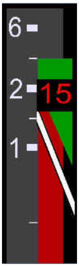
L2 The TCAS detects a Resolution Advisory (RA).

Indications:

Audio

For more information on the audio indicators, *Refer to DSC-34-SURV-40-20 Audio Indicators*.

SD page



The vertical speed scale appears on the PFD. For more information on the vertical speed scale, *Refer to DSC-34-SURV-40-20 Vertical Speed Scale*.

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

Ident.: PRO-ABN-SURV-MEM35-00022204.0002001 / 06 NOV 14

Always follow RA orders, even if this results in crossing the intruder altitude, because these orders ensure the best altitude separation.

CAUTION	Be aware that the intruder may have a TCAS, and may maneuver in response to a coordinated RA order. Therefore, not following an RA order could compromise safe separation.

- **If the flight crew uses the HUD:**

  Revert to PFD.

L2 The HUD does not display the green and red areas of the vertical speed scale.

L1 ■ **If AP/FD TCAS mode is available:**

- **If the AP is off:**

  FD ORDERS........................FOLLOW

  The AP can be engaged

VERTICAL SPEED........................MONITOR

L2 If a preventive RA was triggered: Check that the vertical speed remains out of the red area of the vertical speed scale.

If a corrective RA was triggered: Check that the vertical speed gets out of the red area, and remains in the green area of the vertical speed scale.

L1

CAUTION	If for any reason during an RA, the aircraft vertical speed does not reach the green area of the vertical speed scale, the Pilot Flying (PF) should disconnect the AP, and override the FD orders, in order to lead the aircraft vertical speed out of the red area of the vertical speed scale. If necessary, the PF must use the full speed range between $V\alpha_{max}$ and V_{max}.

- **If any "CLIMB" audio indicator sounds during the final approach:**

  AP/FD TCAS ORDERS........................MONITOR/FOLLOW

  GO-AROUND........................CONSIDER

L2 If the flight crew performs a go-around, the AP/FD TCAS mode disengages, and the SRS GA mode engages. The AP/FD does no longer follow the RA orders. The flight crew must fly manually the TCAS order and follow the vertical speed indications on the vertical speed scale.

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

L1

Respect stall, TAWS, or windshear warning.
ATC .... NOTIFY

- **When the "CLEAR OF CONFLICT" audio indicator sounds:**

L2

The AP/FD TCAS mode disengages. For more information, *Refer to DSC-22-FG-70-100-40 Introduction*.

L1

AP/FD .... MONITOR/FOLLOW
ATC .... NOTIFY
LATERAL AND VERTICAL GUIDANCE.......... ADJUST

L2

The flight crew should engage an appropriate vertical mode, or adjust the vertical speed target, in accordance with the latest ATC clearance.

L1

SPEED.......... ADJUST

L2

The flight crew should adjust the speed target, and revert to managed speed, as appropriate.

L1

■ **If the AP/FD TCAS mode is not available:**

AP (if engaged).......... OFF
FDs.......... OFF
Respond promptly and smoothly.
VERTICAL SPEED.......... ADJUST or MAINTAIN

L2

Adjust or maintain the vertical speed as required, depending on the green area, and/or to avoid the red area of the vertical speed scale.

Note: *Avoid excessive maneuvers while attempting to maintain the vertical speed just outside the red area of the scale, and within the green area. If necessary, use the full speed range between* $V\alpha_{max}$ *and* V_{max}.

L1

Respect stall, TAWS, or windshear warnings.
ATC .... NOTIFY

- **When the "CLEAR OF CONFLICT" audio indicator sounds:**

ATC .... NOTIFY
LATERAL AND VERTICAL GUIDANCE.......... ADJUST

L2

Adjust the lateral and vertical guidance to resume normal navigation, in accordance with ATC clearance.

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

L1 AP/FD .... AS RQRD

L2 If necessary, reengage the AP/FD.

L1 ● **If any "CLIMB" audio indicator sounds during the final approach:**

GO AROUND.. PERFORM

ATC ....NOTIFY
LATERAL AND VERTICAL GUIDANCE....................ADJUST

L2 The flight crew should engage an appropriate vertical mode, or adjust the vertical speed target, in accordance with the latest ATC clearance.

L1
SPEED....................ADJUST

L2 The flight crew should adjust the speed target, and revert to managed speed, as appropriate.

L1 ■ **If the AP/FD TCAS mode is not available:**

AP (if engaged).................... OFF
FDs.................... OFF

Respond promptly and smoothly.
VERTICAL SPEED.................... ADJUST or MAINTAIN

L2 Adjust or maintain the vertical speed as required, depending on the green area, and/or to avoid the red area of the vertical speed scale.

Note: *Avoid excessive maneuvers while attempting to maintain the vertical speed just outside the red area of the scale, and within the green area. If necessary, use the full speed range between* $V\alpha_{max}$ *and* V_{max}.

L1
Respect stall, TAWS, or windshear warnings.
ATC .... NOTIFY

- **When the "CLEAR OF CONFLICT" audio indicator sounds:**

ATC ....NOTIFY
LATERAL AND VERTICAL GUIDANCE....................ADJUST

L2 Adjust the lateral and vertical guidance to resume normal navigation, in accordance with ATC clearance.

L1
AP/FD ....AS RQRD

L2 If necessary, reengage the AP/FD.

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

L1

- **If any "CLIMB" audio indicator sounds during the final approach:**

GO AROUND.. PERFORM

[MEM] WINDSHEAR WARNING - PREDICTIVE WINDSHEAR

Applicable to: ALL

Ident.: PRO-ABN-SURV-MEM610-00007795.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2

If the Predictive Windshear System (PWS) detects windshear on the aircraft path, one of the following audio indicator is triggered:
- During takeoff, "WINDSHEAR AHEAD"
- During approach, "GO AROUND, WINDSHEAR AHEAD".

For more information on the PWS, *Refer to DSC-34-SURV-30-10 Predictive Windshear (PWS) Function*.
For more information on audio indicators, *Refer to DSC-34-SURV-30-20 Audio Indicators*.

Continued on the following page

[MEM] WINDSHEAR WARNING - PREDICTIVE WINDSHEAR (Cont'd)

Ident.: PRO-ABN-SURV-MEM610-00007811.0001001 / 03 JAN 20

L2 *Note: If the flight crew verifies and confirms that there is no risk of windshear, they may disregard the alert, provided that:*
- *There are no others signs of possible windshear conditions*
- *The reactive windshear function is operative.*

There are reported cases that specific environments (e.g. obstacles) cause the spurious triggering of predictive windshear alerts, during either takeoff or landing. However, the flight crew must always rely on all reactive windshear (i.e. WINDSHEAR) alerts.

L1
- **Before V1:**

RTO...PERFORM

- **After V1, or when airborne (initial climb, or during approach and landing):**

THRUST LEVERS...TOGA
AP (if engaged)...KEEP ON
SRS ORDERS...FOLLOW

IF WINDSHEAR IS ENTERED, DO NOT CHANGE CONFIGURATION.

CAREFULLY MONITOR FLIGHT PATH AND SPEED.

Note: If the FD bars are not displayed, move toward an initial pitch attitude of 15 °. Then, if necessary to prevent a loss of altitude, increase the pitch attitude.

[MEM] WINDSHEAR WARNING - REACTIVE WINDSHEAR

Applicable to: ALL

Ident.: PRO-ABN-SURV-MEM630-00007796.0001001 / 06 NOV 14

ANNUNCIATIONS

Triggering Conditions:

L2 The PRIMs detect windshear (reactive windshear) during takeoff or landing.
For more information, *Refer to DSC-22-27-20 Reactive Windshear Detection*.
Indications:

Audio
"Windshear, Windshear, Windshear"

Ident.: PRO-ABN-SURV-MEM630-00021018.0001001 / 06 NOV 14

L2 Both PFDs display the WINDSHEAR warning, during the takeoff and landing phases. This warning is associated with a WINDSHEAR, WINDSHEAR, WINDSHEAR audio indicator.
If windshear is detected, either by the systems, or by the flight crew, apply the following recovery techniques.

Continued on the following page

[MEM] WINDSHEAR WARNING - REACTIVE WINDSHEAR (Cont'd)

Ident.: PRO-ABN-SURV-MEM630-00007813.0001001 / 03 JUL 20

1

On ground, at takeoff:

L2 During the takeoff roll, "WINDSHEAR, WINDSHEAR, WINDSHEAR" alert is inhibited. Windshear recognition is based on the flight crew observation.

L1
- **Before V1:**

  If there are significant variations in airspeed, and in airspeed trend below the indicated V1, reject the takeoff.

  L2 *If windshear occurs during the takeoff roll, the aircraft may reach V1 later (or sooner) than expected. The flight crew should ensure that there is sufficient runway remaining to stop the aircraft, if necessary.*

L1
- **After V1:**

  THR LEVERS....................TOGA
  REACHING VR....................ROTATE NORMALLY
  SRS ORDERS....................FOLLOW

When airborne, during initial climb, or at landing:

THR LEVERS AT TOGA....................SET OR CONFIRM
AP (if engaged)....................KEEP ENGAGED
SRS ORDERS....................FOLLOW

L2 *If necessary, the flight crew may apply full backstick.*

L1 DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF WINDSHEAR.

CAREFULLY MONITOR FLIGHT PATH AND SPEED.

RECOVER SMOOTHLY TO CLIMB, WHEN OUT OF WINDSHEAR.

Note: *If the FD bars are not displayed, move toward an initial pitch attitude of 15 °. Then, if necessary to prevent a loss of altitude, increase the pitch attitude.*

TAIL STRIKE (Cont'd)

Ident.: PRO-ABN-TAIL_STRK-3128W010-00008208.0001001 / 07 NOV 16

In flight:

L2

If a tail strike occurs at takeoff, limit FL to 100 or MEA-MORA to minimize pressure change.

Note: *An aircraft vertical speed of +1 000 ft/min (with a maximum of +1 500 ft/min) should be targeted for climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent should be limited to about -500 ft/min (with a maximum of -800 ft/min), except for the final approach that must be performed normally.*

Turn off PACK 1 and PACK 2, open the RAM AIR, and return to the airport for damage assessment.

T.O ACCELERATION DEGRADED ◁ (Cont'd)

Ident.: PRO-ABN-T-O-2792W010-00023575.0004001 / 03 JAN 19

Crew awareness.
A ZFW entry error is one of the reasons for the Takeoff Monitoring (TOM) function to trigger this alert. For more information on the other possible root causes and on the TOM function, *Refer to DSC-22-FMS-10-70-10 Takeoff Monitoring (TOM) Function (If Installed)*.

T.O RWY TOO SHORT

Applicable to: ALL

Ident.: PRO-ABN-T-O-2272W050-00011503.0001001 / 05 JUL 16

ANNUNCIATIONS

Triggering Conditions:

L2 The engines are set to takeoff power, and the takeoff surveillance function determines that the computed liftoff distance is more than the available runway length.
For more information about the liftoff distance check of the takeoff surveillance function, *Refer to DSC-22-FMS-10-70-20 Takeoff Surveillance Function*.

The alert remains displayed:
- During 5 min after the flight crew retards the thrust levers below the CLB detent, or
- Until the flight crew presses the T.O CONFIG pb while the triggering conditions are not true.

Ident.: PRO-ABN-VENT-2126W050-00005173.0001001 / 01 JUL 14

ANNUNCIATIONS

Triggering Conditions:

L2 The avionics overboard valve is failed.

L3 This alert occurs in case of:
- The big flap of the overboard valve is not fully closed after the first engine start
- The small flap of the overboard valve is not fully open when the AVNCS EXTRACT pb-sw is set to **OVRD.**

[ABN] WHEEL TIRE DAMAGE SUSPECTED

Applicable to: ALL

Ident.: PRO-ABN-WHEEL-9032W200-00023514.0001001 / 07 JUL 16

ANNUNCIATIONS

Triggering Conditions:

L2 To display this procedure, the flight crew must press the ABN pb on the ECP, and then select the WHEEL TIRE DAMAGE SUSPECTED in the L/G-WHEEL section.
The flight crew applies this procedure when a damage is suspected on one or several tires. For more information, *Refer to FCTM/PR-AEP-WHEEL Wheel Tire Damaged Suspected*.
Indications:

SD page

WHEEL SD Page

1 Ident.: PRO-ABN-WHEEL-9032W200-00023515.0002001 / 07 JUL 20

AUTO BRK : DO NOT USE

L2 *The autobrake should not be used in order to ensure braking is applied without delay at touchdown. In some cases, a tire burst may lead to a disconnection of the autobrake at landing.*

L1 FOR LDG : USE DIFF BRAKING AS RQRD

L2 *A tire burst may lead to asymmetry during braking. In this case, differential braking may be needed for lateral control.*

Intentionally left blank

STANDARD OPERATING PROCEDURES (SOP)

Ident.: PRO-NOR-SOP-10-00005563.0001001 / 09 MAR 16
Applicable to: ALL

SOPs consist of inspections, preparations, and normal procedures. All items of a given procedure are listed in a sequence that follows a standardized scan of the cockpit panels, unless that sequence goes against the action priority logic, to ensure that the flight crew performs all actions in the most efficient way.

A panel scan sequence and flow pattern at the beginning of some flight phases indicate where the actions are performed. The flight crewmembers must apply the flow patterns to ensure that they perform the necessary actions for a specific flight phase, before completing the applicable checklist.

The SOPs assume that all systems are operating normally, and that all automatic functions are used normally.

The FCOM also contains normal procedures that are non-routine procedures in the Supplementary Procedures chapter and in the Special Operations chapter.

Intentionally left blank

SAFETY EXTERIOR INSPECTION

Applicable to: ALL

Ident.: PRO-NOR-SOP-30-A-00005573.0001001 / 06 MAY 15

GENERAL

Safety exterior inspections ensure that the aircraft and the external environment of the aircraft are safe for operation. When the flight crew arrives at the aircraft, they must check for, or be informed of any obstructions near the aircraft, engineering activity, or refueling activity, etc.

Intentionally left blank

GENERAL

Ident.: PRO-NOR-SOP-40-00005577.0001001 / 08 JUL 19
Applicable to: ALL

The flight crew performs the preliminary cockpit preparation to ensure that all required safety checks are completed.
The safety checks prevent the inadvertent operation of aircraft systems, danger to the aircraft, and danger to the personnel.

The preliminary cockpit preparation includes:
- Aircraft setup
- Battery Check/External Power
- OIS initialization
- ECAM/Logbook check
- APU start
- OIS preparation.

AIRCRAFT SETUP

Applicable to: ALL

L1 ALL BAT pb-sw (BAT 1, BAT EMER 1, BAT EMER 2, BAT 2).................................. ON | CM2

The crew must ensure that the voltage of all batteries is above 27.1 V before takeoff.

L2 *Switch on the batteries in this specific order: BAT 1, BAT EMER 1, BAT EMER 2, BAT 2. This prevents the display of spurious dispatch messages.*

If a battery voltage is at or below 27.1 V, perform a charging cycle of the batteries with the external power or the APU. A charging cycle lasts in average around 20 min. The flight crew can verify on the ELEC DC SD page, that the batteries charge with both indications:
- *The current is above 1 A*
- *A green arrow is displayed between the DC busbar and the battery indications.*

L1 ● **When the AVAIL light is on:**

EXT 1(2) pb..AUTO | CM2

In order to avoid electrical reconfigurations:
- When only one electrical power is available, connect EXT PWR 2
- When two electrical powers are available, connect EXT PWR 2 before EXT PWR 1.

BATTERIES/EXTERNAL POWER

Ident.: PRO-NOR-SOP-40-00024180.0001001 / 03 JUL 20

L2 *The flight crew should maintain the TEST pb pressed during the time of the test.*

L1 **TEST RESULT**

Check that the engines, APU and main landing gear bay fire detection and extinguishing systems are operative:

- The continuous repetitive chime sounds
- All ENG FIRE pb-sw and the APU FIRE pb-sw come on red
- All SQUIB lights of the ENG and APU AGENT pb come on
- All DISCH lights of the ENG and APU AGENT pb come on
- The FIRE light of the MLG BAY light comes on red
- The MASTER WARN lights flash
- The ECAM displays the ENG 1 FIRE, ENG 2 FIRE, APU FIRE, MLG BAY FIRE alerts
- All FIRE lights on the ENG MASTER panel come on.

Ident.: PRO-NOR-SOP-40-C-00005590.0003001 / 03 JAN 20

APU START

L2 For more information, *Refer to APU Normal Operations*.

L1

APU MASTER SW pb-sw	ON	CM2

APU START pb ....ON | CM2

Note: *If the APU start failed, Refer to APU Abnormal Operations.*

- **When the APU is AVAIL:**

  APU BLEED pb-sw ....ON | CM2

  L2 *Do not use APU bleed if the ground crew confirms that an air start unit or air conditioning unit is connected to the aircraft.*
  To determine if an air start unit is connected, the flight crew should check on the BLEED SD page, if there is pressure in the bleed air system.

  L1 XBLEED selector ....AUTO | CM2
  AIR FLOW selector ....NORM | CM2

  L2 *As long as the number of passenger is not entered in the FMS, airflow is automatically adjusted to the maximum number of passengers.*
  As soon as the number of passengers is entered, during FMS initialization, airflow is automatically adjusted to the actual number of passengers.

  L1 COCKPIT selector ....AS RQRD | CM2
  CABIN selector ....PURS SEL | CM2
  EXT PWR ....AS RQRD | CM2

  L2 When the APU GEN is ON, the EXT PWR 1 does not supply the electrical network.

  - **If EXT PWR 1 was used before APU start:**

    EXT 1 pb ....PRESS | CM2

    Note: *the AVAIL light comes on.*

  The flight crew may keep EXT PWR 2 to reduce the APU load, particularly in hot weather conditions.

L1

- **If APU start on BAT:**

  The following spurious dispatch messages may be displayed on the DISPATCH page:

  - ELEC RAT SHEDDING REDUNDANCY,
  - COND VENT LOCAL CTL REDUNDANCY.

  Contact maintenance to clear the spurious dispatch messages, or apply MEL:

  - For ELEC RAT SHEDDING REDUNDANCY: *Refer to MMEL/ME-DM-ELEC ELEC RAT SHEDDING REDUNDANCY*,
  - For COND VENT LOCAL CTL REDUNDANCY: *Refer to MMEL/ME-DM-COND COND VENT LOCAL CTL REDUNDANCY*.

OIS PREPARATION

Applicable to: ALL

Ident.: PRO-NOR-SOP-40-D-00005596.0001001 / 27 JUN 17

PRELIMINARY PERFORMANCE DETERMINATION

L2 For more information, *Refer to FCTM/PR-NP-SOP-40 OIS Preparation*.

L1 Compute the preliminary performance data in accordance with the technical condition of the aircraft and/or any other criteria that may impact the performance data (e.g. NOTAM, runway condition, aircraft configuration).

AIRFIELD DATA..OBTAIN | CM1-CM2

- **If dispatch under MEL or CDL and in accordance with the logbook:**

  MEL/CDL ITEMS (as appropriate)........................CHECK ACTIVATED | CM1-CM2

  L2 *As appropriate, check that the MEL and CDL items are activated in the T.O PERF application.*

L1 OIS PRELIMINARY TAKEOFF PERF DATA........................COMPUTE | CM1-CM2

L2 *Both flight crewmembers independently compute the preliminary takeoff performance data.*

L1 OIS PRELIMINARY TAKEOFF PERF DATA........................CROSSCHECK | CM1-CM2

L2 *Both flight crewmembers compare their OIS to ensure that the computations are the same.*

GENERAL

Ident.: PRO-NOR-SOP-50-00020454.0001001 / 03 MAY 17
Applicable to: ALL

The exterior walkaround ensures that the general condition of the aircraft is satisfactory and that the visible aircraft components and equipment are safe for the flight:

- There is no impact damage to the structure
- There is no evident fuel, oil, or hydraulic leak
- All ground access doors are closed.

The flight must perform a complete walkaround before each flight.
The parking brake must be set to ON during the exterior walkaround, in order to enable the flight crew to check brake wear indicators.

WARNING	If any landing gear door is open, do not apply hydraulic power until clearance is obtained from ground personnel.

The illustrations available in the Exterior Walkaround section are typical illustrations and may not reflect the exact configuration of the aircraft.

GENERAL

Ident.: PRO-NOR-SOP-60-00006477.0001001 / 25 APR 14
Applicable to: ALL

The PF and PM should perform the cockpit preparation, in accordance with the defined panel scan sequence and tasksharing.
The PF prepares the overhead panel, the center instrument panel and the pedestal while the PM performs the external walkaround. When both flight crewmembers are seated and the PM checked the FMS, both flight crewmembers continue the cockpit preparation.

WARNING	Do not pressurize the hydraulic systems until clearance is obtained from ground personnel.

Ident.: PRO-NOR-SOP-60-B-00006529.0001001 / 25 APR 14

ACTIVE F-PLN CHECK

ACTIVE FLIGHT PLAN..........CHECK and COMPLETE AS APPROPRIATE | PF

L2 *Use the computerized flight plan as reference for routing and fuel predictions.*

- *Check the EOSID on the ND PLAN mode, if applicable*
- *Check the F-PLN and the ND PLAN mode vs. the computerized flight plan or the navigation charts (on the FMS ACTIVE/INIT page, the flight crew can access the route summary via the RTE SUMMARY button)*
- *Check the distance to destination along the F-PLN. Compare it with the total distance computed by the computerized flight plan*
- *Modify the active flight plan, as appropriate.*

Ident.: PRO-NOR-SOP-60-B-00006530.0001001 / 29 NOV 18

SEC F-PLN

CAUTION	The SEC 1(2)(3) flight plan data of the previous flight may not be automatically erased after landing.

SECONDARY FLIGHT PLANS DATA.......... CHECK | PF

L2 *On the FMS SEC INDEX page, review the SEC 1(2)(3) F-PLN and delete remaining data from the previous flight if appropriate.*
The associated SEC 1(2)(3) data from the previous flight can be erased via the DELETE button on the SEC 1(2)(3) panel of the SEC INDEX page.

L1 SECONDARY FLIGHT PLANS.......... AS APPROPRIATE | PF

L2 *Create the SEC 1, SEC 2, and SEC 3 F-PLN, as appropriate, using the FMS SEC INDEX page.*
The flight crew can use SEC 1 and SEC 2 to copy the active F-PLN, and to anticipate a runway change, an immediate return, or a diversion immediately after takeoff.
For an anticipated takeoff runway change, the flight crew must compute the takeoff performance accordingly.
The flight crew can load an ATC flight plan in the SEC 3 only.

Ident.: PRO-NOR-SOP-60-B-00006532.0001001 / 27 JUN 17

FMS DATA CROSSCHECK

L2 For more information, *Refer to FCTM/PR-NP-SOP-60 FMS Preparation*.

L1 FMS PREPARATION.......... CHECK | PM

L2 *After the PF prepared the FMS, the PM checks all the data entered in the FMS. This check includes a crosscheck of performance data displayed on the PM's OIS with the T.O panel of the FMS ACTIVE/PERF page.*

GLARESHIELD

Applicable to: ALL

Ident.: PRO-NOR-SOP-60-E-00006486.0001001 / 25 APR 14

GENERAL

Perform the glareshield preparation when both flight crewmembers are seated and after the PM checked the FMS.

Ident.: PRO-NOR-SOP-70-A-00006543.0001001 / 08 JUL 19

LOADSHEET

FINAL LOADSHEET.. CHECK | BOTH

L2 *Carefully check the final loadsheet, particularly for significant errors. Make sure that the loadsheet data is correct (e.g. correct flight number, aircraft, dry operating weight/CG, configuration, fuel on board).*

L1 FUEL ON BOARD...CHECK | BOTH

L2
- *On the permanent data of the SD, check that the Fuel On Board (FOB) corresponds to the F-PLN and to the loadsheet*
- *On ECAM FUEL page, check that the fuel is correctly balanced*
- *Crosscheck that the sum of the FOB recorded at the end of the last flight and the fuel uplift (if any) is consistent with the current FOB. If an abnormal difference is found, a maintenance action is due.*

FOB after refueling:	***Abnormal difference above:***
Up to 15 t (33 000 lb)	*600 kg (1 300 lb)*
Between 15 t (33 000 lb) and 35 t (77 000 lb)	*700 kg (1 500 lb)*
Between 35 t (77 000 lb) and 55 t (121 000 lb)	*800 kg (1 700 lb)*
Between 55 t (121 000 lb) and 75 t (165 000 lb)	*900 kg (2 000 lb)*
Between 75 t (165 000 lb) and 90 t (198 000 lb)	*1 000 kg (2 200 lb)*
Between 90 t (198 000 t) and 110 t (242 000 lb)	*1 100 kg (2 400 lb)*
More than 110 t (242 000 lb)	*1 200 kg (2 600 lb)*

L1 ZFW/ZFWCG in FMS...CHECK/REVISE | PF

L2 *The PF compares the ZFW/ZFWCG of the loadsheet with the ZFW/ZFWCG entered in the FMS ACTIVE/FUEL & LOAD page, and revises them if necessary.*

L1 PAX NBR in FMS..CHECK/REVISE | PF
ZFW/ZFWCG in FMS...CROSSCHECK | PM
LOADSHEET TOCG AND ECAM GWCG.......................................CROSSCHECK | BOTH

L2 *Check the loadsheet TOCG vs. the ECAM GWCG:*
- *If the difference is less than 1 %, no further action is required. Rely on ECAM GWCG.*
- *If there is more than 1 % difference, check that the ZFW and the ZFWCG are correctly entered in the FMS, then rely on ECAM GWCG.*

L1 ECAM GWCG ....CHECK WITHIN OPERATIONAL LIMITS | BOTH

L2 *Check that the Gross Weight CG displayed on the permanent data of the SD is within the CG operational limits.*

L1 THS FOR_ .... CHECK/REVISE | PF

L2 *Use the TOCG indicated on the loadsheet as the reference for insertion of the T.O CG in the FMS ACTIVE/PERF page.*

PARKING BRAKE, NOSEWHEEL STEERING AND BEFORE START CHECKLIST BELOW THE LINE

■ **If pushback is not required:**

PARK BRK handle .... CHECK ON | PF
PARK BRK indication..CHECK DISPLAYED | PF

L2 *When the parking brake is set to ON and the pressure is effective on brakes, the slats/flaps display shows the PARK BRK indication.*

L1 BEFORE START C/L below the line..COMPLETE | BOTH

Refer to PRO-NOR-C-L Before Start.

L2 *For additional information on the associated standard callouts, Refer to PRO-NOR-SCO Summary for Each Flight Phase.*

L1 ■ **If pushback is required:**

L2 For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 N/W STEER DISC MEMO.. CHECK DISPLAYED | PF

L2 *In the case of a pushback (towbarless or conventional), the ground crew should set the tow pin to the towing position on the steering nose gear panel. The N/W STEER DISC memo on the ECAM indicates this position.*

L1

CAUTION	*If the ECAM does not display the N/W STEER DISC memo, but the ground crew confirms that the tow pin is in the towing position, do not start the engines during pushback in order to avoid possible damage to the nose landing gear upon yellow hydraulic pressurization.* *To dispatch the aircraft in such a case, Refer to MMEL/32–50–02A Towing mode not available when the NWS DISCONNECT switch is in the towing position*

BEFORE START C/L below the line..COMPLETE | BOTH

Refer to PRO-NOR-C-L Before Start.

L2 *For additional information on the associated standard callouts, Refer to PRO-NOR-SCO Summary for Each Flight Phase.*

L1 PARK BRK handle ....OFF | PF

CAUTION	*Do not use the brakes during pushback, unless required due to an emergency.*

- **When pushback is completed:**

  PARK BRK handle ....ON | PF
  PARK BRK indication.. CHECK DISPLAYED | PF

L2 *When the parking brake is set to ON and the pressure is effective on brakes, the slats/flaps display shows the PARK BRK indication.*
Ask the ground crew for towbar disconnection.

AUTOMATIC ENGINE START

Ident.: PRO-NOR-SOP-80-00006556.0002001 / 08 JUL 19

1 **Applicable to: ET-ATQ, ET-AUC, ET-AVB, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB**

L2 For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 ENG START selector ....IGN START | PF

L2 *The ENG SD page appears.*

L1 *Note:* *High tailwinds (higher than 15 kt) may have an adverse effect on start. It may be necessary to reposition the airplane into the wind.*

ENGINE 1 START..........ANNOUNCE | PF

Note: *For any operational reason, engine 2 can be started first.*

- **After all amber crosses and messages have disappeared from the ED and ENG SD page:**
  ENG 1 MASTER lever .... ON | PF

L2 *Note:*
- *Parameter callouts are not mandatory.*
- *During engine start, the oil quantity indication on the ENG SD page decreases due to oil gulping effect. Triggering of the oil quantity advisory may occur during engine start and engine warm-up, and the indication may temporarily reach zero. The flight crew can continue normal engine operations, due to the fact that the oil quantity will increase during the warm-up period.*

On the ED	On the SD
	The corresponding start valve is open. The bleed pressure is green. The engine LP valve is open.
	N3 increases. Oil pressure increases.
	At 25 % N3 and 8 % N2 with EGT < 150 °C: - FF increases - The indication of the active igniter (A or B) appears.
40 s (maximum) after FF increases: - EGT increases - N1 increases.	
	At 48 % N3: - The corresponding start valve is closed - Ignition indication no longer appears.

L1 ● **When the engine reaches idle (i.e. AVAIL appears on the ED):**
ENG IDLE PARAMETERS.......................CHECK | PF

L2 *At ISA, sea level, with bleed off, check that:*
- *THR is approximately 3.7 %*
- *EGT is approximately 450 °C*
- *N1 is approximately 19 %*
- *N2 is approximately 58 %*
- *N3 is approximately 62 %*
- *FF is approximately 700 kg/h (1 543 lb/h).*

L1 ENGINE 2 START.......................ANNOUNCE | PF
ENG 2 MASTER lever.......................ON | PF

Apply the same procedure as indicated for engine 1.

AUTOMATIC ENGINE START

Ident.: PRO-NOR-SOP-80-00006556.0001001 / 08 JUL 19

2 **Applicable to: ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AVC, ET-AVD, ET-AVE, ET-AWM**

L2 For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

TAKEOFF DATA

- **If takeoff conditions changed:**

  OIS FINAL TAKEOFF PERF DATA..........................RECOMPUTE | BOTH

  L2 *The PF and the PM independently compute again the takeoff performance data.*

  L1 FMS TAKEOFF DATA..........................REVISE | PM

  L2 *The PM revises the takeoff data in the FMS. If the flight crew uses the optimum configuration option for the computation, they should pay specific attention to changes to the configuration of the slats/flaps at takeoff.*

  L1 OIS FINAL TAKEOFF PERF DATA..........................XCHECK WITH AVNCS | PF

  L2 *The XCHECK WITH AVNCS function enables the flight crew to automatically check takeoff performance data. For more information, Refer to DSC-46-OIS-20-80-90 Xcheck with Avionics Button. In addition, the PF should compare the runway, T.O shift and the engine-out acceleration altitude from their OIS TAKEOFF PERF application with the T.O panel of the FMS ACTIVE/PERF page.*

  L1 FLAPS lever..........................AS APPROPRIATE | PM

Ident.: PRO-NOR-SOP-100-100-00006584.0001001 / 25 APR 14

AFS/FLIGHT INSTRUMENTS

F-PLN (SID, TRANS).. REVISE or CHECK | PM

L2 *Carefully confirm that the ATC clearance agrees with the FMS, if NAV mode is used.*

L1 INITIAL CLIMB SPEED AND SPEED LIMIT.................. REVISE or CHECK | PM

L2 *Revise the SPD panel of the FMS ACTIVE/VERT REV page associated with the departure, or the CLB waypoint.*

L1 MFD.. IN TAKEOFF CONFIGURATION | BOTH

L2 *The PF displays the T.O panel of the FMS ACTIVE/PERF page.*
The PM displays the FMS ACTIVE/F-PLN page.

L1 CLEARED ALTITUDE ON AFS CP.. SET | PM

L2 *On the PFD, crosscheck and confirm the first cleared altitude.*

L1 HDG ON AFS CP.. PRESET, AS RQRD | PM

L2 *If the ATC requires a heading after takeoff, or in the case of a radar vector departure, preset the heading on the AFS CP. NAV disarms. For more information, Refer to DSC-22-FG-110 How to Define a HDG/TRK Preset before Takeoff.*

L1 FD.. CHECK ON | BOTH
PFD/ND.. CHECK | BOTH

L2 *Check that the PFD (e.g. airspeeds, initial target altitude, heading, slats/flaps configuration, FMA modes) and the ND indications (SID) are in accordance with the departure.*

Ident.: PRO-NOR-SOP-100-100-00006585.0001001 / 25 APR 14

TAKEOFF BRIEFING

TAKEOFF BRIEFING.. CONFIRM | PF

L2 *For more information, Refer to FCTM/PR-NP-SOP-100 Takeoff Briefing Confirmation.*

Ident.: PRO-NOR-SOP-100-100-00024774.0001001 / 08 NOV 18

EFIS CP

EFIS OPTIONS (WX pb or TERR pb).. AS RQRD | BOTH

L2 *Consider the following settings:*
- *WX pb set to ON, on the PF side*
- *TERR pb set to ON, on the PM side.*

Note: *When the flight crew presses the WX pb on the EFIS CP, it takes up to 30 s to fill the buffer with radar data, and to have the complete WX display available on the ND and on the VD.*

Ident.: PRO-NOR-SOP-100-100-00006586.0001001 / 25 APR 14

AUTO BRK

A/BRK pb..ARM | PM

L2 *BRK RTO appears on the FMA.*

Ident.: PRO-NOR-SOP-100-100-00006587.0001001 / 25 APR 14

ND MODE AND RANGE....................... AS RQRD | BOTH

Ident.: PRO-NOR-SOP-110-110-00006604.0001001 / 25 APR 14

TCAS

TA pb....................... TA ONLY or TA/RA | PM

L2 *TA/RA is the default mode of the TCAS.*

The flight crew may use the TA ONLY mode in specific airports, and for specific procedures (identified by Operators) that may provide resolution advisories that are neither wanted nor appropriate (e.g. closely-spaced parallel or converging runways).

Ident.: PRO-NOR-SOP-110-110-00006601.0001001 / 05 NOV 15

BEFORE ENTERING THE RUNWAY

STROBE sw..ON | PF

L2 *During taxi, the PF may request the PM to set the exterior lights.*

L1 APPROACH PATH..CLEARED OF TRAFFIC | BOTH

L2 *Check that the approach path is clear of traffic, visually and using TCAS display on ND.*

L1 TAKEOFF RUNWAY..CONFIRM | BOTH

L2 *Confirm that the line-up is performed on the intended runway. Useful aids are:*

- *The runway markings*
- *The runway lights*
  Be careful that in low visibility, edge lights could be mixed up with the center line lights
- *The ILS signal*
  If the runway is ILS equipped, the flight crew can press the LS pb: the LOC deviation should be centered after line-up
- *The ND (runway symbol, ANF runway ident box).*

Ident.: PRO-NOR-SOP-110-110-00006595.0001001 / 25 APR 14

CABIN CREW

CABIN CREW..ADVISE | PM

L2 *Advise the cabin crew that takeoff is imminent.*

THRUST SETTING

L2 For more information on thrust setting, *Refer to FCTM/PR-NP-SOP-120 Thrust Setting*.
For more information on takeoff roll, *Refer to FCTM/PR-NP-SOP-120 Takeoff Roll*.
For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 The below procedure is the standard takeoff procedure. However, rolling takeoff is permitted.

TAKEOFF........ANNOUNCE | PF
THR........25 % | PF

L2 *Apply 25 % THR on all engines with brakes set to on. However, the flight crew can release the brakes to perform a rolling takeoff.*

L1
- **If the crosswind is at or below 25 kt and there is no tailwind:**

  SIDESTICK........HALF FORWARD | PF

  L2 *To counter the nose-up effect of setting engine takeoff thrust, apply half forward stick until the airspeed reaches 80 kt.*

  L1 BRAKES........RELEASE | PF
  THRUST LEVERS........FLX or TOGA | PF

  L2 *Once the thrust levers are set to FLX or TOGA detent, the Captain maintains their hand on the thrust levers, until the aircraft reaches V1.*

L1
- **In case of tailwind, or if the crosswind is above 25 kt:**

  SIDESTICK........FULL FORWARD | PF

  L2 *To counter the nose-up effect of setting engine takeoff thrust, apply full forward stick until the airspeed reaches 80 kt.*

L1 BRAKES....................RELEASE | PF
THR....................INCREASE | PF

L2 *Increase THR progressively to reach CL detent at 20 kt ground speed and FLX (or TOGA) detent at 40 kt ground speed.*

L1
- **At 20 kt ground speed:**
  THRUST LEVERS....................CL | PF

  L2 *The ENG THR LEVERS NOT SET ECAM alert may briefly appear. The alert will disappear when the pilot sets the thrust levers to FLX or TOGA at 40 kt.*

L1
- **At 40 kt ground speed:**
  THRUST LEVERS....................FLX or TOGA | PF

  L2 *Once the thrust levers are set to FLX or TOGA detent, the Captain maintains their hand on the thrust levers, until the aircraft reaches V1.*

L1 CHRONO....................START | PM
DIRECTIONAL CONTROL....................USE RUDDER | PF
PFD/ND....................MONITOR | PM

L2 *If NAV PRIMARY LOST, check on the ND the FMS position: i.e. that the aircraft is on the runway centerline.*

Ident.: PRO-NOR-SOP-120-120-00006608.0001001 / 25 APR 14

BELOW 80 KT

L2 For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 TAKEOFF THRUST....................CHECK | PM

L2 *Below 80 kt, check the thrust setting, i.e. check that the actual THR of each engine reached the thrust rating limit and the thrust target indicated by the blue dot.*

L1 THRUST SET....................ANNOUNCE | PM
PFD and ENG indications....................MONITOR | PM

L2 *Scan the airspeed, THR and EGT throughout the takeoff.*

Ident.: PRO-NOR-SOP-120-120-00021498.0001001 / 06 AUG 14

AT 80 KT

SIDESTICK....................RELEASE | PF

L2 *Release the sidestick gradually to reach neutral at 100 kt.*

Ident.: PRO-NOR-SOP-120-120-00006609.0001001 / 25 APR 14

AT 100 KT

L2 For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 ONE HUNDRED KNOTS.......................ANNOUNCE | PM
ONE HUNDRED KNOTS.......................CROSSCHECK | PF

L2
- *Below 100 kt, the Captain can decide to abort the takeoff, depending on the circumstances*
- *Above 100 kt, rejecting the takeoff is a more serious matter.*

Ident.: PRO-NOR-SOP-120-120-00006610.0001001 / 25 APR 14

AT V1

AT VR

L2 For more information, *Refer to FCTM/PR-NP-SOP-120 Rotation Technique*.
For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 ROTATION.......................ORDER | PM
ROTATION.......................PERFORM | PF

L2
- *At VR, rotate the aircraft with a positive sidestick input to achieve a continuous rotation rate of about 3 °/s, toward an initial pitch attitude of 12.5 ° (10 ° with one engine inoperative).*
- *Minimize lateral inputs on ground and during the rotation, to avoid spoiler extension. In strong crosswind conditions, small lateral stick inputs may be used, if necessary, to aim at maintaining wings level.*
- *After liftoff, follow the SRS guidance.*

Note: *If a tail strike occurs, the ECAM triggers the TAIL STRIKE alert. For more information, Refer to procedure.*

Ident.: PRO-NOR-SOP-120-120-00006612.0001001 / 30 JUN 14

WHEN POSITIVE CLIMB

L2 For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 POSITIVE CLIMB....................ANNOUNCE | PM

L2 *Announce positive climb, when the vertical speed indication is positive and the radio altitude has increased.*

L1 L/G UP....................ORDER | PF
L/G lever ....SELECT UP | PM
AP....................AS RQRD | PF

L2 *5 s after liftoff, the flight crew can engage AP 1 or AP 2.*

Ident.: PRO-NOR-SOP-120-120-00006613.0001001 / 25 APR 14

AT THE THRUST REDUCTION ALTITUDE (I.E. LVR CLB FLASHING ON THE FMA)

Intentionally left blank

CLIMB

Applicable to: ALL

Ident.: PRO-NOR-SOP-140-140-00018094.0001001 / 27 SEP 18

AT THE TRANSITION ALTITUDE

BAROMETRIC REFERENCE.. SET STD/CROSSCHECK | BOTH

L2
- *At the transition altitude, the barometric setting flashes on the PFD. The flight crew should set STD on the EFIS CP and on the ISIS SFD*
- *Crosscheck the barometric settings and the altitude indications*
  For more information on the VD in relation to the barometric reference setting, Refer to FCTM/PR-NP-SOP-140 Vertical Display
- *For additional information on the associated standard callouts, Refer to PRO-NOR-SCO Summary for Each Flight Phase.*

Ident.: PRO-NOR-SOP-140-140-00006624.0001001 / 25 APR 14

INITIAL CLIMB

The usual vertical mode is CLB or OP CLB, with managed speed active.

L2 For more information, *Refer to FCTM/PR-NP-SOP-140 Initial Climb*.

L1 CRZ FL.. SET AS RQRD | PF

L2
- *If the ATC clears the aircraft to the scheduled CRZ FL or above, it is not necessary to modify the CRZ FL that was inserted on the ACTIVE/INIT page during the cockpit preparation. The flight guidance automatically takes into account any altitude that the flight crew selects on the AFS CP above the CRZ FL*
- *If the ATC limits the CRZ FL to a level below the level entered on the ACTIVE/INIT page (or below the level that appears on the PERF page) insert this lower CRZ FL on the PERF page. If the flight crew does not enter this lower CRZ FL on the PERF page, there is no transition to the CRZ phase. Therefore, the managed speed/Mach targets are not modified and A/THR soft mode is not available. In that case, the FMA displays ALT instead of ALT CRZ in the second column.*

L1 CLIMB SPEED MODIFICATIONS..AS RQRD | PF

L2 *For more information, Refer to FCTM/PR-NP-SOP-140 Speed Considerations.*

Ident.: PRO-NOR-SOP-140-140-00006625.0001001 / 25 APR 14

Ident.: PRO-NOR-SOP-150-150-00006628.0001001 / 27 SEP 18

ALT CRZ

ALT CRZ on FMA	CHECK/ANNOUNCE	PF

L2 *Check that the aircraft flies at the cruise flight level indicated in the FMS ACTIVE/PERF page.*
For more information, Refer to FCTM/PR-NP-SOP-150 FMS Use.

Ident.: PRO-NOR-SOP-150-150-00006629.0001001 / 14 APR 16

ECAM

L2 In cruise, the tasksharing is left to the flight crew's appreciation.

L1

ECAM MEMO	REVIEW	PF
SD PAGES	REVIEW	PF

L2 *Periodically review SD pages and, in particular:*

- *ENG: ENG oil pressure and temperature*
- *BLEED: For bleed parameters*
- *ELEC: For electrical parameters and GEN load*
- *HYD: For fluid quantity. After landing gear retraction, the indicated fluid quantities are above the indicated fluid quantities on ground*
- *F/CTL: Note any abnormal control surface position*
- *FUEL: For fuel quantity and distribution*
- *DOOR/OXYGEN: For oxygen pressure.*

Ident.: PRO-NOR-SOP-150-150-00006630.0001001 / 03 DEC 15

FLIGHT PROGRESS

FLIGHT PROGRESS	CHECK	PF

L2 *Note:* *VLS on the PFD ensures a 0.3 g margin with respect to the buffet onset. No additional margin is necessary in cruise.*

L1 Monitor the flight progress, the navigation, the fuel quantity and the distribution, as usual.

L2 For more information on fuel temperature, *Refer to FCTM/PR-NP-SOP-150 Fuel Temperature*.

L1 **WHEN OVERFLYING A MANUALLY ENTERED WAYPOINT**

- Check the track and distance to the next waypoint
- Check the wind and update it if the current wind is significantly different.

WHEN OVERFLYING A WAYPOINT, OR EVERY 30 MIN

- Check the fuel: Check the FOB on the permanent data, and the fuel predictions in the FMS ACTIVE/FUEL & LOAD page, and compare them with the computerized flight plan.
- Check that there is no fuel leak.
  L2 For more information about the fuel leak detection, *Refer to FCTM/PR-AEP-FUEL Fuel Leak*.
- L1 On the CRUISE page, check the (FOB + FU)-BLOCK.
  If the value is abnormally negative, suspect a fuel leak.
  L2 For more information about the fuel leak detection, *Refer to FCTM/PR-AEP-FUEL Fuel Leak*.
  L1 If the value is abnormally positive, suspect a fuel quantity over read.

Check/compare the DEST EFOB on the F-PLN page with the MIN FUEL AT DEST available on the FUEL & LOAD FMS page.

L2 If the EFOB at destination is below the specified MIN FUEL AT DEST, the DEST EFOB ECAM MEMO appears on the WD, and the DEST EFOB BELOW MIN message appears on the FMS message area. However, the flight crew should be aware that many factors has an effect on the fuel consumption such as the actual flight level, the cruise speed, or weather conditions. The FMS takes into account those parameters to compute the fuel predictions.

L2 *Click on the SYNCHRO ECAM button in order to update the last ECAM alerts that occurred during the flight.*

L1 LANDING CONDITIONS....................CONFIRM | PF-PM

Perform an in-flight landing performance assessment if the landing conditions changed compared with the landing distance computation at dispatch, or with a previous computation (e.g. runway, weather conditions, in-flight failure affecting performance, diversion).

L2 *For more information, Refer to FCTM/PR-NP-SOP-160 Landing Performance.*

L1 ● **If landing conditions changed:**

LANDING PERF DATA....................COMPUTE | PF-PM

L2 *The PF and the PM independently compute the landing distance performance data, based on the new conditions at arrival.*

L1 *Note:* 1. *If the weather conditions are expected to change at the landing airport, or in the event of significant precipitation, the flight crew should consider a second calculation of the in-flight landing distance with the worst possible runway condition.*

2. *The selection of REV MAX is the standard practice for landing.*
However, on DRY runways the flight crew may select REV IDLE.
On WET runways (runway surface condition GOOD), the flight crew may select REV IDLE, if all of the following conditions are satisfied:

- *A landing distance assessment has been made with the following parameters for the in-flight landing distance computation:*
  - *MEDIUM TO POOR landing performance level*
  - *No reverser credit.*
- *The result of this in-flight landing distance assessment is within the LDA.*

LANDING PERF DATA....................CROSSCHECK | PF-PM

L2 *The PF and the PM compare their OIS to ensure that the computations are the same. For more information, Refer to FCTM/PR-NP-SOP-160 Content of a Landing Performance Data Crosscheck.*

Ident.: PRO-NOR-SOP-160-160-00006638.0001001 / 03 APR 20

FMS

L2 For more information, *Refer to FCTM/PR-NP-SOP-160 Approach Preparation*.

L1 During the time that the PF prepares the arrival in the FMS, the PF should transfer the controls to the PM.

L2 For more information on the associated standard callouts, *Refer to PRO-NOR-SCO PF/PM Duties Transfer*.

L1 FMS ACTIVE/F-PLN/ARRIVAL page..INSERT/CHECK | PF

L2 *Insert APPR, STAR, TRANS, and APPR VIA, if applicable.*

L1 FMS ACTIVE/F-PLN page...CHECK | PF

L2
- *Check that the F-PLN agrees with the planned approach and missed approach*
- *Check the F-PLN (approach and Missed Approach tracks and distances) vs. the approach charts, using the ND in PLAN mode as necessary*
- *Check speed constraints. Add new speed constraints if required.*
- *Check altitude constraints. Add new altitude constraints if required.*

L3 *Note:* *The FMS may have deleted the altitude constraints that are at or above the CRZ FL, or at or above any previous lower CRZ FL in the case of step climbs (Refer to ALT CSTR).*

In that case:
- *Insert again the affected procedures (STAR, APPR, VIA or TRANS)*
  The FMS keeps the altitude constraints that are below the CRZ FL, and deletes again the altitude constraints that are above current CRZ FL. The FMS may also delete the altitude constraints that are at current CRZ FL, and the altitude constraint windows that have a constraint at or above current CRZ FL.
- *Manually enter the altitude constraints that are below current CRZ FL using the FMS ACTIVE/F-PLN page.*

It is not possible to enter an altitude constraint at the CRZ FL.
In the case of an "AT" or "AT OR ABOVE" altitude constraint at the CRZ FL, ensure that the altitude constraint is met before initiating the descent.

L2
- *In all cases, do not modify the final approach (FAF or FAP to runway or MAP), including altitude constraints.*
- *Insert the winds associated with the descent profile.*

For approaches using FPA guidance:
- Identify the position and the altitude at which the final descent starts
- Check the value of the FPA
- Identify the Missed Approach Point (MAP).

L1 DES panel of the FMS ACTIVE/PERF page.................................... INSERT/CHECK | PF

- *Before the descent, check the MANAGED MACH/SPD*
- *If a speed different from the ECON Mach/speed is required, insert that Mach/speed in the ECON entry fields.*

L2 *The managed speed profile of the descent has a default speed limit of 250 kt below 10 000 ft. The flight crew can delete or modify this speed limit, if necessary, on the SPD panel of the FMS ACTIVE/F-PLN/VERT REV page.*

L1 APPR panel of the FMS ACTIVE/PERF page.................................. INSERT/CHECK | PF

- Enter the destination QNH, temperature, and wind.

L2 Insert the average wind given by the ATC or ATIS. Do not insert the gust values. During approach, the Ground Speed Mini function (managed speed mode), takes into account the instantaneous gust. For more information, Refer to Ground Speed Mini Function.
For example, if the wind is 15020G35KT, insert 150/20.

L1 - Insert the MINIMUM (i.e. BARO or RADIO), as applicable.

L2
  - To avoid undershooting the published MDA (MDH) during a go-around due to the aircraft inertia during the pull-up, some Authorities may require Operators to add a specific number of feet to the published MDA (MDH)
  - In the case of a CAT III approach without DH, the flight crew should enter NONE, NO, NO DH, or NODH in the RADIO entry field of the APPR panel of the ACTIVE/PERF page.

L1 - Check or modify the landing configuration.
- In the case of an in-flight failure that affects the landing performance and increases the VAPP, use the LDG PERF application for VAPP computation. Insert the computed VAPP in the APPR panel of the FMS ACTIVE/PERF page

L2 The flight crew can modify VAPP. The ground speed mini-function takes into account this new value.

L1 - Check or modify the transition flight level.

GA panel of the FMS ACTIVE/PERF page.. CHECK | PF

L2 *Check the THR RED and ACCEL altitudes, and modify them if necessary.*

L1 FMS POSITION/MONITOR page...INSERT | PF

L2 *On the FMS POSITION/MONITOR page, insert the landing runway threshold in the BRG/DIST TO entry field, for position monitoring during descent.*

L1 FMS ACTIVE/FUEL & LOAD page..CHECK | PF

L2 *Check the estimated landing weight, EFOB and extra fuel.*

L1 FMS POSITION/NAVAIDS page...CHECK | PF

L2
- *Set the NAVAIDS, as required, and check the VOR/ ADF ◁ idents on the NDs and the ILS (GLS) ident on the PFDs*
- *For an ILS approach, check the frequency and the course*
- *For a GLS approach ◁ or an approach using SLS function ◁ , check the channel and the course.*

L1 SEC pages..AS RQRD | PF

L2 *The flight crew should prepare a SEC F-PLN before the top of descent, either to an alternative runway for destination, or to the landing runway in the case of circling. In all cases, the routing to the alternate should be available. If there is a last-minute runway change, then the flight crew only needs to activate the appropriate SEC F-PLN, without forgetting to set the new MINIMUM and NAVAIDS.*

L1 FMS PREPARATION..CHECK | PM

L2 *After the PF prepares the FMS, the PM checks all the data entered in the FMS.*

Ident.: PRO-NOR-SOP-160-160-00021000.0001001 / 06 MAY 14

LANDING ELEVATION

LDG ELEVN..CHECK | PF

L2 *Check that LDG ELEVN appears on the CRUISE page, and check the associated value.*

APPROACH BRIEFING

L2 For more information, *Refer to FCTM/PR-NP-SOP-160 Approach Briefing*.

L1 APPROACH BRIEFING..PERFORM | PF

L2 *The main objective of the approach briefing is for the PF to inform the PM of the planned course of action for the approach.*
It is recommended to use the FMS pages as a guide for the descent and approach briefing.
The briefing should include a review of the "Management of Degraded Navigation" chapter:
Refer to Approach Using XLS guidance - Management of Degraded Navigation, or
Refer to Approach Using FPA Guidance - Management of Degraded Navigation, or
Refer to Approach Using APP-DES Guidance - Management of Degraded Navigation

Ident.: PRO-NOR-SOP-160-160-00006644.0001001 / 27 MAY 14

ANTI ICE

ANTI ICE pb-sw..AS RQRD | PM

L2 *During the descent, set to ON the ENG ANTI ICE pb-sw when icing conditions exist or are anticipated.*
When the engines are at idle, the use of the anti-ice reduces the descent path angle. If needed, the flight crew can compensate this behavior by increasing the descent speed, or by extending the speed brakes, as necessary.

Ident.: PRO-NOR-SOP-160-160-00006643.0001001 / 25 APR 14

DESCENT CLEARANCE

DESCENT CLEARANCE..OBTAIN | PM
CLEARED ALTITUDE ON AFS CP..............................SET | PF

L2 *When the flight crew obtains the ATC clearance, they should set the cleared altitude (FL) on the AFS CP taking into account the safe altitudes.*
If the lowest safe altitude is above the cleared altitude, check with the ATC to determine if this constraint applies.
If the ATC confirms that this constrain applies, set the safe altitude on the AFS CP until it is safe to reach the cleared altitude.

DESCENT

Applicable to: ALL

Ident.: PRO-NOR-SOP-170-170-00006645.0001001 / 27 SEP 18

DESCENT INITIATION

DESCENT.. INITIATE | PF

L2 *The standard method to initiate the descent is to engage the DES mode at the Top of Descent (T/D) computed by the FMS.*

For more information on T/D and profile computation, *Refer to FCTM/PR-NP-SOP-170 Computation Principle*.

- **When the aircraft reaches the T/D:**

  ALT knob ....PUSH | PF

  DES mode engages.

  - **If the ATC requires an early descent:**

    Use the DES mode.

    The DES mode guides the aircraft down to a lower vertical speed, in order to converge with the required descent path. (The flight crew may use a V/S of 1 000 ft/min).

  - **If the ATC delays the descent:**

    Beyond the T/D, the T/D REACHED message appears on the PFD and MFD. This suggests that the flight crew should reduce the speed toward green dot speed with ATC permission.

    When cleared for descent, engage DES mode with the managed speed active.

Ident.: PRO-NOR-SOP-170-170-00006646.0001001 / 08 JUL 19

DESCENT MONITORING

L2 For more information , *Refer to FCTM/PR-NP-SOP-170 Guidance and Monitoring*.

L1 DESCENT..MONITOR | PF

L2 - *When flying in NAV mode, use the DES mode.*

- *Monitor the VERT DEV*
  The VERT DEV appears on the PFD and on the DES panel of the ACTIVE/PERF page.
- *Monitor the speed change that occurs when the aircraft reaches the speed change symbol ● in managed speed.*
- *Monitor the FMA when the aircraft reaches the level-off symbol (i.e. ↘ or ↘)*

  Note: *The NDs display a level-off symbol ↘ along the flight path. The position of this symbol is based on the current active modes: i.e. AP/FD and A/THR.*

- *Monitor the predicted descent point after the next level-off.*

- *When flying in HDG or TRACK mode and therefore, out of the lateral F-PLN, the DES mode is not available. Only V/S / FPA or OP DES mode is available for descent.*
  The target altitude is the AFS CP selected altitude, and the altitude constraints are not taken into account.
  FMS predictions assume a return to the lateral F-PLN and to the descent flight path.

- *Monitor the VERT DEV*
  The PFD displays the VERT DEV. The flight crew can use the VERT DEV to monitor the descent provided that the crosstrack error is less than 5 NM. To monitor the descent, the flight crew should use the level-off symbol ↘ in addition to the energy circle on the ND.
- *Monitor the speed change that occurs, when the aircraft reaches the speed change symbol ● in managed speed.*
- *Monitor the FMA when the aircraft reaches level-off symbol ↘.*
- *Check the predictions before engaging again the DES mode, in order to resume the descent profile.*

Ident.: PRO-NOR-SOP-170-170-00018774.0001001 / 25 APR 14

DESCENT ADJUSTMENT

RATE of DESCENT...ADJUST, AS RQRD | PF

L2 *To increase the rate of descent, increase the descent speed by using the selected speed, if comfort and the ATC permit. It is more cost-effective (Time/Fuel) than using the speed brakes:*

- *Maintain a high speed as long as possible, provided that the ATC permits to fly above the speed limits*
- *If the aircraft is high and at high speed, it is more efficient to keep the high speed until ALT* then to decelerate at level-off, instead of combining descent and deceleration.*

If the aircraft goes below the desired profile, use the selected speed and the V/S mode to adjust the rate of descent.
In the OP DES mode, the flight crew can use the speed brakes to increase the rate of descent. The flight crew can also use the speed brakes to maintain the required rate of descent, when engine anti-ice is used.
In the DES mode, if the aircraft is on, or below the flight path and the ATC requires a higher rate of descent, do not use the speed brakes because the rate of descent is imposed by the planned flight path. Therefore, the A/THR may increase thrust to compensate for the increase in drag. In this case, use the OP DES mode with speed brakes.

Ident.: PRO-NOR-SOP-170-170-00006652.0001001 / 22 JAN 15

EFIS CP

EFIS OPTIONS (WX pb or TERR pb).. AS RQRD | BOTH

L2 *Consider the following settings:*
- *WX pb set to ON, on the PF side*
- *TERR pb set to ON, on the PM side.*

L1 ● **When the aircraft approaches the transition level, and when cleared for an altitude:**
BAROMETRIC REFERENCE.. SET/CROSSCHECK | BOTH

L2 *Set the preset QNH on the EFIS CP and on the ISIS SFD.*
Crosscheck the barometric reference settings and the altitude indications.

Note: *The flight crew must take into account any QNH change on the EFIS CPs, ISIS SFD, and on the APPR panel of the FMS ACTIVE/PERF page.*
For additional information on the associated standard callouts, Refer to PRO-NOR-SCO Summary for Each Flight Phase.

Ident.: PRO-NOR-SOP-170-170-00006654.0001001 / 09 MAR 16

AT 10 000 FT

LDG lights sw..ON | PM

L2 *The flight crew may set to ON the landing lights, depending on the airline policy, or following regulatory recommendations.*

L1 SEAT BELTS sw..ON | PM
CSTR pb on EFIS CP..ON | BOTH
LS pb...AS RQRD | BOTH

L2 *Press the LS pb, if one of the following approaches is planned:*
- *ILS*
- *GLS* ⊲
- *LOC, ILS G/S out, or LOC B/C*

- *Approaches with the FLS function*
- *Approaches with the SLS function* .

L1 NAVAIDS..AS RQRD/CHECK | PF

L2 *Ensure that the appropriate navaids are tuned and identified.*

L1 ● **If NAV PRIMARY LOST:**

NAVIGATION ACCURACY..MONITOR | PF

L2 *Crosscheck the navigation accuracy by using the POSITION/MONITOR page (i.e. BRG/DIST TO computed data) and the ND (i.e. VOR/DME raw data).*
The navigation accuracy check determines the autopilot mode that the flight crew should use for the approach, and the type of ND displays.

Approach General

INTRODUCTION

Ident.: PRO-NOR-SOP-180-A-00018907.0001001 / 09 MAR 16
Applicable to: ALL

The APPROACH section provides the Standard Operating Procedures (SOP) for the following approach types:

- ILS approaches
- GLS ◁ approaches
- Conventional approaches: VOR, VOR-DME, NDB (with ADF ◁ option), NDB-DME (with ADF ◁ option)
- Approaches based on a LOC signal without any G/S signal: LOC, ILS G/S OUT, LOC B/C
- RNAV approaches including:
  - RNAV(GNSS) approaches with LNAV, LNAV/VNAV, LP (with SLS ◁ option) or LPV (with SLS ◁ option) minima
  - RNAV(RNP) approaches for which Authorization is Required (AR).

Note: *In relation to the names in the ICAO Performance-Based Navigation (PBN) Manual:*
- *"RNP APCH operations" corresponds to RNAV(GNSS) approaches*
- *"RNP AR APCH operations" corresponds to RNAV(RNP) approaches.*

CROSS-REFERENCE TABLE

Ident.: PRO-NOR-SOP-180-A-00020415.0001001 / 09 MAR 16

For Circling Approach, *Refer to PRO-NOR-SOP-180-C Circling Approach - General*.

FLYING REFERENCE

Ident.: PRO-NOR-SOP-180-A-00018917.0001001 / 25 APR 14
Applicable to: ALL

Use the following recommended flying reference:
- In vertical managed modes: HDG-V/S reference
- In vertical selected modes: TRK-FPA reference.

STABILIZATION CRITERIA

Ident.: PRO-NOR-SOP-180-A-00018918.0001001 / 05 DEC 17
Applicable to: ALL

The stabilization height is defined as one of the following:
- 1 000 ft above airfield elevation in Instrument Meteorological Conditions (IMC), or
- 500 ft above airfield elevation in Visual Meteorological Conditions (VMC), or
- Any other height defined in Operator policies or regulations.

In order for the approach to be stabilized, all of the following conditions must be satisfied before, or at the stabilization height:

- The aircraft is on the correct lateral and vertical flight path
- The aircraft is in the desired landing configuration
- Thrust is stabilized, usually above idle, and the aircraft is at target speed for approach

  Note: *In IMC, a later speed and thrust stabilization can be acceptable provided that:*
  - *It is in accordance with Operator policies and regulations*
  - *The aircraft is in deceleration toward the target approach speed*
  - *The flight crew stabilizes speed and thrust as soon as possible and not later than 500 ft AAL.*

- The flight crew does not detect any excessive flight parameter deviation.

If one of the above-mentioned conditions is not satisfied, the flight crew must initiate a go-around, unless they estimate that only small corrections are required to recover stabilized approach conditions.

APPROACH SPEED TECHNIQUE

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-A-B-00018924.0001001 / 25 APR 14

DECELERATED APPROACH

The decelerated approach with FD or AP/FD guidance is the standard technique for approaches using xLS guidance.

Ident.: PRO-NOR-SOP-180-A-B-00018925.0001001 / 08 JUL 19

EARLY STABILIZED APPROACH

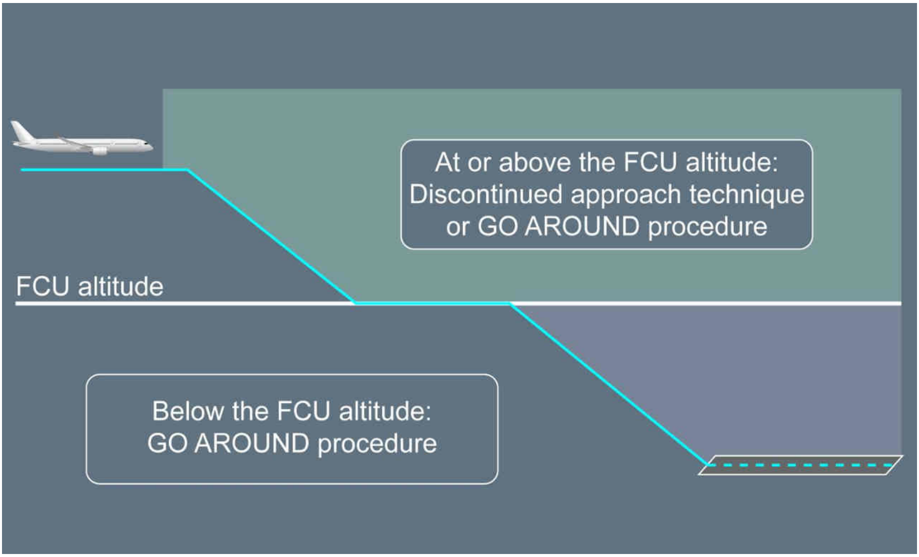
Under certain circumstances, the flight crew may decide to reduce the speed down to VAPP in the landing configuration at the Final Descent Point (i.e. approach via selected guidance, high glide path angle, low altitude intermediate approach, etc.). In order to obtain a valuable deceleration pseudo waypoint and to ensure a timely deceleration, the flight crew should enter VAPP as a speed constraint at the Final Descent Point.

DISCONTINUED APPROACH

Ident.: PRO-NOR-SOP-180-A-00020416.0001001 / 25 APR 14
Applicable to: ALL

In order to discontinue an approach when the aircraft is at or above the altitude selected on the FCU, the flight crew can either:
- Apply the GO AROUND procedure, or
- Apply the discontinued approach technique.

When the aircraft is below the FCU altitude, the flight crew must apply the GO AROUND procedure.



At or above the FCU altitude:
Discontinued approach technique
or GO AROUND procedure
FCU altitude
Below the FCU altitude:
GO AROUND procedure

- **If at or above the FCU altitude:**
  Announce "CANCEL APPROACH".
  To disarm any approach mode, press APPR pb or LOC pb.
  Select lateral mode as required (NAV or HDG mode).
  Select vertical mode as required.
  Select SPEED and adjust.
- **If F-PLN has no destination anymore:**
  Perform a LAT REV at the last waypoint and redefine the destination at the NEW DEST field.

Note:
1. *The FMS does not automatically string the previous flown approach in the active F-PLN. When the last waypoint is sequenced, the FMS has no more destination in the F-PLN.*
2. *Because the thrust levers are not set to TOGA detent, the FMS remains in approach phase.*

Intentionally left blank

Aircraft Configuration Management

INITIAL APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-B-A-00018930.0001001 / 06 MAY 15

GENERAL

The initial approach procedure described here is a general guidance whatever the type of approach expected.

Ident.: PRO-NOR-SOP-180-B-A-00018931.0001001 / 06 AUG 14

INITIAL APPROACH

F-PLN SEQUENCING............ADJUST | PF

L2
- *A good clue to monitor the proper F-PLN sequencing is the TO waypoint on the upper right side of the ND, which should remain meaningful*
- *In NAV mode, the F-PLN will sequence automatically*
- *In HDG or TRACK mode, the F-PLN waypoints will sequence automatically only if the aircraft flies close to the F-PLN route.*

L1 APPROACH PHASE............CHECK/ACTIVATE | BOTH

L2
- *If the aircraft overflies the DECEL pseudo waypoint in NAV mode, the APPR phase activates automatically*
- *If the aircraft is in HDG or TRACK mode, approximately 15 NM from touchdown, activate and confirm the APPR phase on the FMS ACTIVE/PERF page.*

L1 MANAGED SPEED............CHECK | PF
FLIGHT PATH............MONITOR | PF

L2
- *In NAV mode, use the VERT DEV on the PFD and on the DES panel of the ACTIVE/PERF page*
- *In HDG or TRACK mode, use the energy circle on the ND that shows the required distance to land.*

L1 SPEED BRAKES lever..........AS RQRD | PF

L2 *If the flight crew uses the speed brakes to increase the rate of deceleration or to increase the rate of descent, VLS increases. As a result:*

- *The flight crew should check that the speed margin is appropriate before the extension of the speed brakes*
- *If the speed brakes are extended, the flight crew should check that the speed margin is appropriate before the beginning of a turn.*

This will avoid the activation of the Alpha-Floor protection.

L1 NAV ACCURACY..........MONITOR | PM

L2
- *When NAV PRIMARY is available, no NAV ACCURACY monitoring is required*
- *If NAV PRIMARY LOST is displayed, check on FMS POSITION/MONITOR page that the required navigation accuracy is appropriate to the phase of flight*
- *If the accuracy is LOW, at least one ND must be in ROSE LS/VOR depending on the approach.*

INTERMEDIATE/FINAL APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-B-B-00018938.0001001 / 27 SEP 18

GENERAL

The intermediate and the final approach procedure described here is a general guidance whatever the type of approach expected.

Ident.: PRO-NOR-SOP-180-B-B-00018939.0001001 / 03 JUL 14

AT GREEN DOT SPEED

FLAPS 1..........ORDER | PF
FLAPS 1..........SELECT | PM

L2
- *FLAPS 1 should be selected more than 3 NM before the Final Descent Point*
- *Check the aircraft deceleration toward S speed*
- *For decelerated approaches, the aircraft must reach or be established on the final descent with FLAPS 1 and S speed at or above 2 500 ft AGL*
- *If the aircraft does not decelerate on the flight path or aircraft speed is significantly above S speed, extend the landing gear in order to slow down. The use of the speed brakes is possible. However, the flight crew should be aware that the use of speed brakes causes an increase in VLS.*

L1 TA pb.......................................TA ONLY or TA/RA | PM

L2 *The flight crew may use the TA ONLY mode in specific airports, and for specific procedures (identified by Operators) that may provide resolution advisories that are neither wanted nor appropriate (e.g. closely-spaced parallel or converging runways).*

Ident.: PRO-NOR-SOP-180-B-B-00018940.0001001 / 06 AUG 14

AT 2500 FT AGL MINIMUM

FLAPS 2.......................................ORDER | PF
FLAPS 2.......................................SELECT | PM

L2 *Check the aircraft deceleration toward F speed.*

- **For approaches using XLS guidance:**
  - If the aircraft intercepts the flight path below 2 500 ft AGL, select FLAPS 2 at one dot below the flight path
  - If the aircraft speed is significantly above F speed on the flight path, or if the aircraft does not decelerate on the flight path, extend the landing gear in order to decelerate the aircraft. The use of the speed brakes is not recommended.

Ident.: PRO-NOR-SOP-180-B-B-00018942.0002001 / 05 NOV 18

WHEN FLAPS ARE AT 2

L/G DOWN.......................................ORDER | PF
L/G lever.......................................SELECT DOWN | PM

L2 *The flight crew should select the L/G lever down as soon as possible when FLAPS are at 2. This ensures that the braking Pre-Land Test (PLT) is complete before touchdown. Aircraft touchdown with the braking PLT in progress may result in tires degradation (flat spots).*
For more information on the braking PLT, Refer to DSC-32-20-10-50 Braking Pre-Land Test (PLT).

L1 RWY COND/BRAKING ACTION.......................................CONFIRM | PM

L2 *Confirm the setting of the RWY COND/BRAKING ACTION selector, in accordance with the latest weather report.*

L1 AUTO BRK.......................................CONFIRM | PM
GND SPLRS.......................................ARM | PM
NOSE sw.......................................T.O | PM

Ident.: PRO-NOR-SOP-180-B-B-00018943.0001001 / 29 NOV 18

WHEN LANDING GEAR IS DOWN

FLAPS 3.......................................ORDER | PF
FLAPS 3.......................................SELECT | PM

L/G DOWNLOCK INDICATION ON PFD .... CHECK | PM

L2 *Check on the PFD Slat/Flap display that the green triangle is displayed.*

L1 FLAPS FULL..ORDER | PF
FLAPS FULL...SELECT | PM

L2 *Check that the aircraft decelerates to VAPP.*

L1 A/THR .... .CHECK IN SPEED MODE OR OFF | PM

L2 *For LAND 3 capability, A/THR must be ON.*

L1 SLIDING TABLE... STOW | BOTH
LDG MEMO.. CHECK NO BLUE | PM
CABIN REPORT .... RECEIVE | BOTH

L2 *Check CABIN READY on the WD, or obtain the report from the chief purser.*

L1 CABIN CREW...ADVISE | PM

L2 *Advise the cabin crew that landing is imminent.*

L1 LANDING C/L .... COMPLETE | BOTH

Refer to PRO-NOR-C-L Landing

L2 *For additional information on the associated standard callouts, Refer to PRO-NOR-SCO Summary for Each Flight Phase.*

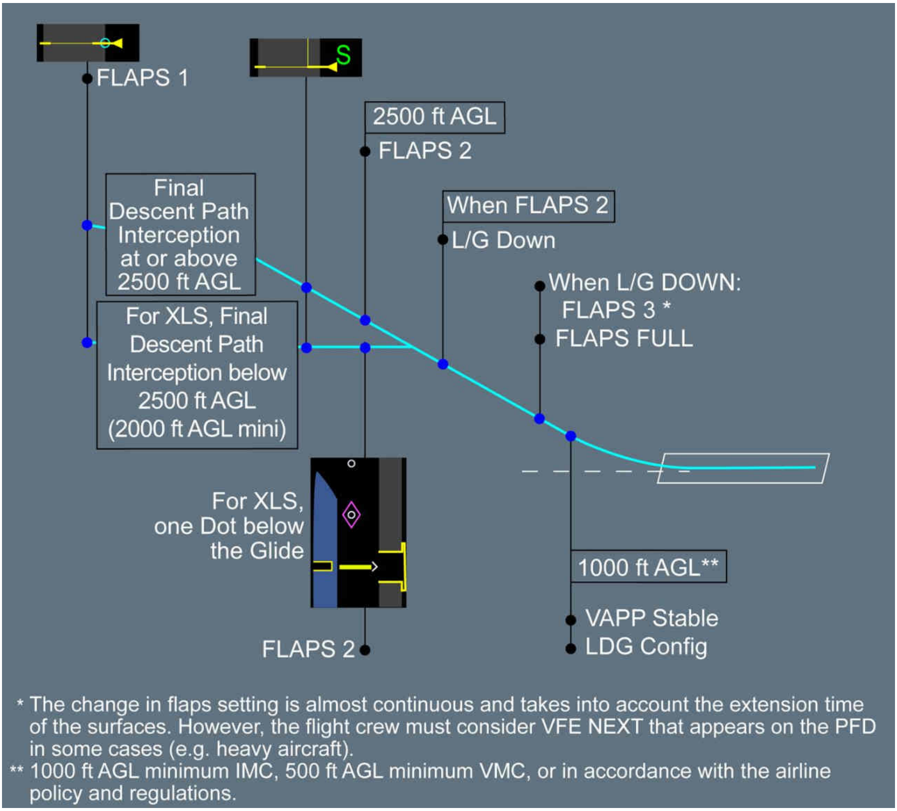
L1 FLIGHT PARAMETERS...MONITOR | PM

L2
- *The PF announces any FMA modification*
- *The PM calls out, if:*
  - *The speed goes below the speed target -5 kt, or goes above the speed target +10 kt*
  - *The pitch attitude goes above 10 °, or below 0 °*
  - *The bank angle goes above 6 °*
  - *The descent rate goes above 1 200 ft/min.*
- *Following PM flight parameter exceedance callout, the suitable PF response will be:*
  - *Acknowledge the PM callout, for proper crew coordination purposes*
  - *Take immediate corrective action to control the exceeded parameter back into the defined stabilized conditions*
  - *Assess whether stabilized conditions will be recovered early enough prior to landing. If not, initiate a go-around.*

Ident.: PRO-NOR-SOP-180-B-B-00018944.0001001 / 06 AUG 14

PATTERN (DECELERATED)

The following approach pattern is based on the assumption that managed speed is used:



FLAPS 1
S
2500 ft AGL
FLAPS 2
Final Descent Path Interception at or above 2500 ft AGL
When FLAPS 2
L/G Down
When L/G DOWN:
FLAPS 3 *
FLAPS FULL
For XLS, Final Descent Path Interception below 2500 ft AGL (2000 ft AGL mini)
For XLS, one Dot below the Glide
FLAPS 2
1000 ft AGL**
VAPP Stable
LDG Config

* The change in flaps setting is almost continuous and takes into account the extension time of the surfaces. However, the flight crew must consider VFE NEXT that appears on the PFD in some cases (e.g. heavy aircraft).

** 1000 ft AGL minimum IMC, 500 ft AGL minimum VMC, or in accordance with the airline policy and regulations.

Intentionally left blank

Aircraft Guidance Management

APPROACH USING XLS GUIDANCE

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-C-A-00018956.0001001 / 09 MAR 16

GENERAL

The following items are to be performed in addition to previous SOP chapters in the following cases:

- ILS approaches
- GLS ◁ approaches
- RNAV(GNSS) approaches with LPV minima using SLS function ◁
- RNAV(GNSS) approaches with LNAV/VNAV or LNAV minima using FLS function
- Conventional approaches based on VOR or NDB (with ADF ◁ option) using FLS function
- LOC, ILS G/S OUT, LOC B/C approaches using FLS function.

Ident.: PRO-NOR-SOP-180-C-A-00020418.0001001 / 04 SEP 14

AIRCRAFT EQUIPMENT

For RNAV(GNSS) approaches, *Refer to PRO-SPO-PBN Required RNP APCH Equipment*.

Ident.: PRO-NOR-SOP-180-C-A-00020419.0001001 / 29 SEP 16

DESCENT PREPARATION

- **For FLS:**

WEATHER AND LANDING INFORMATION ....OBTAIN | PM

L2 *The FLS vertical beam (F-G/S) computation takes into account the effect of low OAT on obstacle clearance if the destination temperature is correctly inserted on the APPR panel of the FMS ACTIVE/PERF page.*

L1 FMS ACTIVE/F-PLN page..CHECK | BOTH

L2
- *0.1 ° of difference between the MFD and the charted final vertical path is acceptable*
- *1 ° of difference between the MFD and the charted final lateral track is acceptable*
- *3 ° of difference between the MFD and the charted final lateral track is acceptable for approach in overlay to a conventional radio NAVAID.*

L1 FLS DATA....................CHECK | BOTH

L2 *Press the LS pb to display FLS data on the PFD and ND:*

- *Check the following FLS data against the published approach chart:*
  - *The anchor point*
  - *The course of the F-LOC(LOC)(LOC B/C) beam*
  - *The slope of the F-G/S beam*
- *On the ND, check the compatibility of the FLS beam with the final approach leg of the flight plan.*

Note: For ILS G/S out and LOC only approaches, FLS data is only composed of the F-G/S beam.

L1 ● **For CAT II / III:**

FLIGHT CREW QUALIFICATION AND CURRENCY....................CHECK | BOTH
AIRCRAFT TECHNICAL STATUS....................CHECK | PF

L2 *Check:*

- *The technical logbook*
- *The MEL (as appropriate)*
- *The required equipment. For more information, Refer to Required Equipment for LAND 2(3) capability.*

L1 AIRPORT STATUS....................CHECK | PF

L2 *Review NOTAMs to check availability of ILS and runway and approach lighting.*

L1 APPROACH BRIEFING....................PERFORM | PF

L2 *Review the following items:*

- *Tasksharing and callouts*
- *Downgrading options*
- *Expected taxi route.*

L1 ● **For ILS G/S OUT:**

G/S....................DESELECT | PF

L2 *On the FMS POSITION/NAVAIDS page, press the DESELECT GLIDE button.*

L1 ● **For GLS CAT I with autoland:**

REQUIRED EQUIPMENT....................CHECK | PF

L2 *Check the required equipment. For more information, Refer to LIM-AFS-20 Required Equipment for GLS CAT I Approach with Autoland.*

L1 FMS POSITION/MONITOR page.. COMPLETE | BOTH

L2 *Insert the runway threshold in the BRG/DIST TO entry field for position monitoring during approach.*

L1 GO-AROUND STRATEGY...REVIEW | PF

L2 *The briefing should include a review of the "Management of Degraded Equipment" chapter.*

Ident.: PRO-NOR-SOP-180-C-A-00020420.0001001 / 14 APR 16

DESCENT

- **For FLS:**

  FLS CAPABILITY...CHECK | PF

L2
  - *For RNAV(GNSS) approach: check that the FMA displays F-APP*
  - *For VOR, NDB (with ADF ◁ option), LOC, ILS G/S OUT, LOC B/C approaches, check that the FMA displays F-APP or F-APP+RAW.*

L1 BAROMETRIC REFERENCE... SET/CROSSCHECK | BOTH

L2 *The vertical guidance requires a precise baro setting. The maximum acceptable discrepancy between altimeters is 100 ft.*

L1

CAUTION	Obstacle clearance is not guaranteed if erroneous baro setting is selected, or if FLS guidance is used outside the published approach.

Ident.: PRO-NOR-SOP-180-C-A-00018957.0001001 / 07 MAY 18

INITIAL/INTERMEDIATE/FINAL APPROACH

APPR pb on AFS CP...PRESS | PF

L2 *Press the APPR pb when all of the following is applicable:*
- *The aircraft is cleared for approach*
- *The aircraft is on the intercept trajectory for the final approach course*
- *The LOC or F-LOC deviation is available on the PFD.*

Depending on the approach, this arms the F-LOC(LOC)(LOC B/C) and F-G/S(G/S) modes.

L3 *The ICAO defines the envelope in which the quality of the G/S signal ensures a normal capture. This envelope is within 10 NM, +/-8 ° from the centerline of the ILS glide path, and up to 1.75 Θ and down to 0.3 Θ (Θ, being the nominal glide path angle).*
If the approach is armed when the aircraft is far outside from the standard glideslope (G/S) capture envelope, a spurious G/S engagement may occur, due to an incorrect G/S deviation signal. This spurious G/S capture will order a pitch up, if the aircraft is below the glide beam, and a pitch down, if the aircraft is above the glide beam.*
Each time that the flight crew notices pitch movement, or a spurious G/S, or a trajectory deviation, they must immediately disconnect the AP, if engaged, in order to re-establish a normal attitude*

and disengage APPR mode. It is then recommended to arm/rearm the APP (ILS) within the normal capture zone.

L1 F-LOC(LOC)(LOC B/C)....................CHECK ARMED | PF
F-G/S(G/S)....................CHECK ARMED | PF

- **For ILS:**

  AP 1+2....................ON | PF

- **For approaches with autoland:**

  APPROACH AND LANDING CAPABILITY....................CHECK | PM

L2 *Check that the FMA displays the approach and landing capability for the intended approach (LAND1, LAND2 or LAND3).*

L1 F-LOC(LOC)(LOC B/C) CAPTURE....................MONITOR | PF
F-G/S(G/S) CAPTURE....................MONITOR | PF

- **When F-G/S*(G/S*):**

  GO-AROUND ALTITUDE....................SET | PF-PM

L2 *This prevents from an undesired level off at the F-G/S or G/S intercept altitude.*

Ident.: PRO-NOR-SOP-180-C-A-00018958.0001001 / 09 MAR 18

F-G/S(G/S) INTERCEPTION FROM ABOVE

The following procedure should only be applied when established on the F-LOC(LOC)(LOC B/C) beam. The flight crew must react without delay to meet the stabilization criteria.

APPR pb on the AFS CP....................PRESS | PF
AFS CP ALTITUDE....................SET ABOVE A/C ALTITUDE | PF

L2 *Select an altitude above the aircraft altitude, in order to prevent inadvertent ALT* engagement.*

L1 V/S / FPA knob....................ADJUST FOR CAPTURE AND PULL | PF

L2 *Do not exceed -2 000 ft/min.*

Ident.: PRO-NOR-SOP-180-C-A-00018959.0001001 / 06 AUG 14

FINAL APPROACH

FLIGHT PARAMETERS....................MONITOR | PM

L2 *The PM calls out if excessive deviation occurs:*

- *F-LOC(LOC)(LOC B/C): ½ dot*
- *F-G/S(G/S): ½ dot.*

For additional information on the associated standard callouts, Refer to Flight Parameters in Approach.

Ident.: PRO-NOR-SOP-180-C-A-00018961.0001001 / 25 APR 14

AT MINIMUM +100 FT

ONE HUNDRED ABOVE....................MONITOR or ANNOUNCE | PM

Ident.: PRO-NOR-SOP-180-C-A-00018962.0002001 / 08 JUL 19

AT MINIMUM

MINIMUM....................MONITOR or ANNOUNCE | PM

L2 *Below minimum, the visual references must be the primary reference until landing.*

L1 ■ **If visual references are sufficient:**

CONTINUE.................... ANNOUNCE | PF

● **For approaches without autoland:**

When appropriate:

AP ....OFF | PF

For minimum use height of AP, Refer to Auto Flight System Limitations.

L2 *Note:*
- *At 150 ft RA, if the AP is still engaged, the message DISCONNECT AP FOR LDG pulses on the FMA as a reminder to the flight crew that autoland is not available for landing*
- *At 50 ft RA, the FD pitch bar disappears*
- *At 50 ft RA, the FPD disappears (for aircraft with HUD).*

L1 ● **For FLS:**

FD ....AS RQRD | PM

L2 *If needed, the PF orders the PM to set both FDs off.*

L1

CAUTION	From minima, the FDs provide an additional guidance. The FDs must be switched off if the guidance is not relevant or not followed.

■ **If visual references are not sufficient:**

GO AROUND....................ANNOUNCE | PF

MANAGEMENT OF DEGRADED EQUIPMENT

- **For VOR, NDB (with ADF ◁ option), LOC, ILS G/S OUT, LOC B/C approaches:**
  - **If the FLS capability downgrades to F-APP + RAW:**

    The flight crew can continue to use FLS:
    - Confirm the FMS position using NAVAID raw data
    - Crosscheck distances versus altitudes as published on the charts.
  - **If the FLS capability downgrades to RAW only:**

    FLS .... DO NOT USE | BOTH

    - **For VOR and NDB (with ADF ◁ option) approaches:**

      APPR pb .... OFF | PF
      LS pb .... OFF | BOTH

      The flight crew can continue the approach: use TRK-FPA guidance.
    - **For LOC, ILS G/S OUT, LOC B/C approaches:**

      The flight crew can continue the approach: disregard the F-G/S deviation and revert to FPA vertical selected mode (the LOC or LOC B/C deviation remain trustful).
- **For RNAV(GNSS) approaches with LNAV or LNAV/VNAV minima :**

  Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
  - F-APP capability lost
  - F-LOC deviation exceeds 1 dot.
  - **For RNAV(GNSS) approaches with LNAV/VNAV minima:**

    Discontinue the approach if the F-G/S deviation exceeds ½ dot below the F-G/S beam.
- **For CAT II / III approaches:**
  In the case of failure (e.g. caution, landing capability degradation), apply the following strategy:
  - **Above 1 000 ft AGL:**

    The approach may be continued:

    ECAM ACTIONS .... COMPLETE | BOTH
    APPROACH AND LANDING CAPABILITY ON FMA .... CHECK | BOTH
    REQUIRED EQUIPMENT .... CHECK | PM

    L2 *For more information, Refer to Required Equipment for LAND 2(3) capability.*

    L1
    - **If required:**

      RVR .... CHECK | PM

DH .... ADJUST | PM
APPROACH BRIEFING.. UPDATE | PF

- **If the flight crew does not complete all the above actions at 1 000 ft AGL:**
  GO-AROUND.. PERFORM | PF

- **Below 1 000 ft AGL:**

  If external visual references are not sufficient:

  GO-AROUND.. PERFORM | PF

- **Below 200 ft AGL (for LAND 3 DUAL):**

  Automatic approach may be continued unless the **AUTOLAND** light comes on. If the **AUTOLAND** light comes on:

  - **Visual references not sufficient:**
    GO-AROUND.. PERFORM | PF

  - **Visual references sufficient:**

    The approach may be continued manually.

APPROACH USING APP-DES GUIDANCE FOR RNP AR

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-C-B-00018913.0001001 / 04 SEP 14

GENERAL

The following items are to be performed in addition to previous SOP chapters and are generic guidelines for RNAV(RNP) approaches. These items may be tailored by the airline for specific airfields according to their OPS approval.

Note: *If the flight crew selects a RNP AR APPR and a RNP AR VIA, the RNP AR VIA shall be flown with the NAV lateral guidance mode. LDEV and VDEV automatically appear while flying the RNP AR VIA for flight parameters monitoring.*

Ident.: PRO-NOR-SOP-180-C-B-00018914.0001001 / 04 SEP 14

AIRCRAFT EQUIPMENT

Refer to PRO-SPO-PBN Required RNP AR Equipment.

Ident.: PRO-NOR-SOP-180-C-B-00018920.0001001 / 02 APR 15

DESCENT PREPARATION

WEATHER AND LANDING INFORMATION....OBTAIN | PM

L2 - *The FMS vertical profile does not take into account the effect of low OAT. Therefore, vertical managed guidance:*
  - *Must not be used when the actual OAT is below the minimum temperature indicated on the approach chart or defined by the Operator, or*
  - *May not be used when temperature corrections are required (APP-DES mode may not engage).*

- *Verify that wind is within limits.*
- *Use of QNH from a remote station is prohibited.*

L1 F-PLN page....CHECK | BOTH

L2 *Check the RNP value for each leg of the RNAV(RNP) procedure. If necessary, modify the RNP value in the FMS POSITION/MONITOR page.*

L1 GO-AROUND STRATEGY....REVIEW | PF

L2 *The briefing should include a review of the "Management of RNP AR Capability" chapter.*

Ident.: PRO-NOR-SOP-180-C-B-00020063.0001001 / 03 JUL 20

1 DESCENT

RNP AR CAPABILITY....CHECK | PF

L2 *Check that the RNP AR capability is compliant with the selected procedure (Refer to DSC-22-FMS-10-30-50 RNP AR Capability).*

L1 TERR on ND....DISPLAY | BOTH

L2 *Unless weather radar is required on one side, the flight crew selects terrain display on both NDs.*

L1 BAROMETRIC REFERENCE....SET/CROSSCHECK | BOTH

L2 *The vertical guidance requires a precise baro setting. The maximum acceptable discrepancy between altimeters is 100 ft.*

Ident.: PRO-NOR-SOP-180-C-B-00018928.0001001 / 03 JUL 20

2 INITIAL / INTERMEDIATE / FINAL APPROACH

FD or AP/FD....USE FOR APPROACH | PF

L2 *For RNP AR operations with RNP <0.3, one AP must be engaged.*

L1 APPR pb on AFS CP..PRESS | PF

L2 - *Press the APPR pb when cleared for approach and prior to start the RNP AR final approach. When APPR pb is pressed, the APP-DES mode arms provided that the flight crew selected one RNAV(RNP) approach on the FMS ARRIVAL page.*

L1 NAV and APP-DES..CHECK ENGAGED | PF

L2 *The flight crew should make the aircraft converge toward the lateral flight plan (e.g. DIR TO CRS IN) and the vertical flight plan (e.g. OP DES).*

APP-DES engages in the vertical capture zone around the flight plan path:
- *Between -50 ft and +250 ft if the flight plan path is in level off, or*
- *Between -250 ft and +250 ft if the flight plan path is in descent.*

L1 GO-AROUND ALTITUDE..SET | PF
FLIGHT PARAMETERS..MONITOR | BOTH

- *Monitor the LDEV displayed on PFDs and the XTK on the NDs.*

L2 *Note:* *LDEV automatically appears when flying a RNP AR approach. On the PFD, one dot equals to a 0.1 NM. On the NDs, the numerical value of the lateral deviation is displayed as soon as it exceeds 0.02 NM.*

L1 - *The PM announces "LAT DEV" if excessive lateral deviation occurs: ½ dot.*

L2 *Note:* *The LDEV value must be compared to the current RNP value displayed on the F-PLN page or on the bottom of the NDs.*

L1 - *Go-around must be initiated if lateral deviation reaches the current RNP value.*

L2 *Note:* *In this case the LDEV flashes on the PFD and XTK pulses on the ND.*

L1 - *Monitor the VDEV displayed on PFD*

L2 *Note:* *VDEV automatically appears when flying a RNP AR procedure and when the FMS flight phase is DES or APPR. One dot equals to a deviation of 100 ft.*

L1 - *The PM announces "VDEV" if excessive vertical deviation occurs: -50 ft or ½ dot below*
- *Go-around must be initiated if vertical deviation reaches -75 ft or ¾ dot below (after the FAF).*

L2 *Note:* *In this case the VDEV flashes on the PFD.*

Ident.: PRO-NOR-SOP-180-C-B-00018934.0001001 / 04 SEP 14

AT MINIMUM +100 FT

ONE HUNDRED ABOVE..MONITOR or ANNOUNCE | PM

Ident.: PRO-NOR-SOP-180-C-B-00018936.0001001 / 03 MAY 17

AT MINIMUM

MINIMUM..........MONITOR or ANNOUNCE | PM

Below minimum, the visual references must be the primary reference until landing.

■ **If visual references are sufficient:**

CONTINUE..........ANNOUNCE | PF

L2 *Maintain the aircraft on a stabilized flight path down to the flare.*

L1 ● **At the latest at the MAP or minimum use height of AP (whichever occurs first):**

AP ....OFF | PF

For minimum use height of AP, Refer to Auto Flight System Limitations.

L2 *Note: At 150 ft RA, if the AP is still engaged, the message DISCONNECT AP FOR LDG pulses on the FMA as a reminder to the flight crew that autoland is not available for landing.*

L1 FD ....AS RQRD | PM

L2 *If needed, the PF orders the PM to set both FDs off.*

L1

CAUTION	- From minima down to the MAP, the FDs provide an additional guidance. The FDs must be switched off if the guidance is not relevant or not followed. - After the MAP, disregard the FDs as they revert to HDG-V/S.

RUNWAY TRACK..........CHECK/SET | PF

L2 *If needed, the PF orders the PM to set the runway track on the AFS CP.*

L1 ■ **If visual references are not sufficient:**

GO-AROUND..........ANNOUNCE | PF

Ident.: PRO-NOR-SOP-180-C-B-00018937.0001001 / 04 DEC 14

MANAGEMENT OF RNP AR CAPABILITY

L2 The aircraft is by default capable of RNP AR operations down to 0.1 NM. ECAM and/or ND only display indication to the flight crew if a failure affects the RNP AR capability.

L1 ● **In the case of RNP AR capability degradation:**

- ECAM displays RNP AR CAPABILITY DOWNGRADED

■ **For RNAV(RNP) approach with RNP 0.3 minima:**

MINIMUM..........ADJUST | PM

■ **For RNAV(RNP) approach with no RNP 0.3 minima:**
GO-AROUND.......................................PERFORM | PM

- **In the case of RNP AR capability lost:**

  - ND displays **RNP AR CAPABILITY LOST**, or
  - ECAM displays RNP AR CAPABILITY LOST.

  If no visual references:

  GO-AROUND.......................................PERFORM | PF

- **In the case of** SURV TAWS FAULT **or** SURV SYS 1+2 FAULT **or** SURV TERR SYS FAULT, **or** SURV GPWS FAULT**:**

  If no visual references:

  GO-AROUND.......................................PERFORM | PF

- **In the case of inconsistency between the terrain and the flight plan:**

  If no visual references:

  GO-AROUND.......................................PERFORM | PF

APPROACH USING FPA GUIDANCE

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-C-C-00018941.0001001 / 09 MAR 16

GENERAL

The following items are to be performed in addition to previous SOP chapters in the following cases:
- RNAV(GNSS) approaches using mixed NAV FPA guidance with LNAV minima only
- RNAV(GNSS) approaches with LP minima (with SLS ◁ option) using mixed LOC FPA guidance
- Conventional VOR and NDB (with ADF ◁ option) approaches using selected TRK FPA or mixed NAV FPA guidance
- LOC, ILS G/S OUT, and LOC B/C approaches.

Ident.: PRO-NOR-SOP-180-C-C-00018945.0001001 / 25 APR 14

AIRCRAFT EQUIPMENT

For RNAV(GNSS) approaches, one FMS must be operative in NAV PRIMARY.

Ident.: PRO-NOR-SOP-180-C-C-00018922.0001001 / 29 SEP 16

DESCENT PREPARATION

FMS ACTIVE/F-PLN page..CHECK | PF

L2 *For approaches using NAV FPA:*
- *1 ° of difference between the MFD and the charted final lateral track is acceptable*
- *3 ° of difference between the MFD and the charted final lateral track is acceptable for conventional radio NAVAID approach.*

L1 FMS POSITION/MONITOR page..COMPLETE | PF

L2 *Insert the runway threshold in the BRG/DIST TO entry field for position monitoring during approach.*

L1 GO-AROUND STRATEGY..REVIEW | PF

L2 *The briefing should include a review of the "Management of Degraded Navigation" chapter.*

- **At 10 000 ft:**
  NAV ACCURACY..CHECK | PF
  - **If NAV accuracy is LOW:**
    TRK MODE..USE FOR APPROACH | PF
  - **For RNAV(GNSS) approach:**
    NAV PRIMARY..CHECK | PF

L2 *NAV PRIMARY must be available on at least one FMS.*

Ident.: PRO-NOR-SOP-180-C-C-00018946.0001001 / 07 MAY 18

INITIAL/INTERMEDIATE/FINAL APPROACH

LATERAL GUIDANCE MODE..SET FOR APPROACH | PF

L2 *Arm NAV(LOC)(LOC B/C) mode as appropriate.*

L1
- **For LOC, ILS G/S OUT, LOC B/C and RNAV(GNSS) approaches with LP minima (with SLS ◁ option):**
  LOC pb ....PRESS | PF

L2 *Press the LOC pb when cleared for approach and on the intercept trajectory for the final approach course. Depending on the approach, this arms the LOC or LOC B/C mode.*

Note: *In NAV mode, the aircraft may leave the F-PLN to capture the LOC.*

L1 LOC(LOC B/C)..CHECK ARMED | PF

LATERAL PATH...INTERCEPT | PF

L2 *Monitor NAV(LOC)(LOC B/C) engagement as appropriate.*

L1 TRK-FPA pb ....SELECT | PF
FPA FOR FINAL APPROACH...SET | PF

- **At 0.3 NM from the Final Descent Point:**

  FPA knob ....PULL | PF
  FPA MODE...CHECK ENGAGED | PF

  L2 *Check NAV FPA(TRK FPA)(LOC FPA)(LOC B/C FPA) is engaged.*

  L1 POSITION/FLIGHT PATH...MONITOR / ADJUST | PF

- **When the aircraft is below the go-around altitude:**

  GO-AROUND ALTITUDE...SET | PF-PM

FLIGHT PARAMETERS...MONITOR | PM

L2
- *Crosscheck distances versus altitudes as published on the charts*
- *If approaching on a conventional radio NAVAID procedure, monitor the lateral and vertical guidance using raw data*
- *For approaches using NAV FPA, monitor XTK error on ND to check the lateral guidance*
- *The PM calls out if excessive deviation occurs:*
  - *Approach using NAV MODE: XTK > 0.1 NM*
  - *Approach using LOC or LOC B/C MODE: LOC ½ dot*
  - *Approach using TRK MODE:*
    - *VOR: ½ dot or 2.5 °*
    - *NDB (with ADF option): 5 °.*

MANAGEMENT OF DEGRADED NAVIGATION

■ **For VOR and NDB (with ADF ◁ option) approaches in NAV FPA, if the lateral guidance is not satisfactory:**

Be prepared to continue the approach with reference to appropriate raw data by reverting to TRK FPA.

■ **For RNAV(GNSS) approaches with LNAV minima:**

Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
- NAV PRIMARY LOST on both ND
- XTK > 0.3 NM
- NAV GNSS / ACFT POS DISAGREE on ECAM.

CIRCLING APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-C-D-00018951.0001001 / 06 AUG 14

GENERAL

The circling approach is the visual phase of an instrument approach to bring an aircraft into position for landing on a runway which is not suitably located for a straight-in approach.

CAUTION	The flight crew must conduct the flight within the circling area, while maintaining required visual references at all times.

Ident.: PRO-NOR-SOP-180-C-D-00018952.0001001 / 06 AUG 14

APPROACH PREPARATION

For a circling approach, the approach preparation should include the following additional items:

ACTIVE F-PLN

INSTRUMENT APPROACH.. INSERT | PF

L2 *On the ACTIVE/F-PLN/ARRIVAL page, insert the instrument approach preceding the circling.*

L1 F SPEED CONSTRAINT AT FAF... INSERT | PF

L2 *Insert F speed as constraint at FAF since the circling approach will be flown in configuration 3, landing gear down and F speed.*

L1 SEC F-PLN

F-PLN..IMPORT ACTIVE | PF

L2 *On the SEC INDEX page, click on the IMPORT button and select IMPORT ACTIVE in order to make a copy of the active flight plan.*

L1 LANDING RUNWAY...REVISE | PF

L2
- *On the SEC/F-PLN/ARRIVAL page, insert the appropriate landing runway*
- *Keep the F-PLN discontinuity.*

Ident.: PRO-NOR-SOP-180-C-D-00018953.0001001 / 06 AUG 14

INSTRUMENT APPROACH

The flight crew flies a stabilized approach at F speed, configuration 3 and landing gear down.

Ident.: PRO-NOR-SOP-180-C-D-00018954.0001001 / 29 NOV 18

CIRCLING APPROACH

VISUAL APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-C-E-00018965.0001001 / 06 AUG 14

GENERAL

Perform the approach on a nominal 3 ° glideslope using visual references. Approach to be stabilized by 500 ft AGL on the correct approach path, in the landing configuration, at VAPP.

Method for visual approach:
- The autopilot is not used
- FDs are OFF

- Use of FPV is recommended
- Use of A/THR is recommended with managed speed.

Bear in mind the possible risk of optical illusions due to hindered night vision.

Ident.: PRO-NOR-SOP-180-C-E-00018966.0001001 / 29 NOV 18

INITIAL/INTERMEDIATE APPROACH

The flight plan selected on the FMS should include the selection of the landing runway.
The downwind leg may also be part of the flight plan. This may be a useful indication of the aircraft position in the circuit on the NDs.

However, the flight crew must use the appropriate visual references.

AT THE BEGINNING OF THE DOWNWIND LEG

APPROACH PHASE ACTIVATION	ORDER	PF
APPROACH PHASE	ACTIVATE	PM
FD OFF	ORDER	PF
FD	OFF	PM
TRK-FPA	ORDER	PF
TRK-FPA	SELECT	PM
A/THR ACTIVE	CHECK	PF

ON THE DOWNWIND LEG

Abeam threshold, extend the downwind leg to 45 s (± wind correction).
Turn into the base leg with a maximum of 30 ° of bank.
Descend with the appropriate FPA in FLAPS 2 at “F” speed.

Ident.: PRO-NOR-SOP-180-C-E-00018967.0001001 / 06 AUG 14

FINAL APPROACH

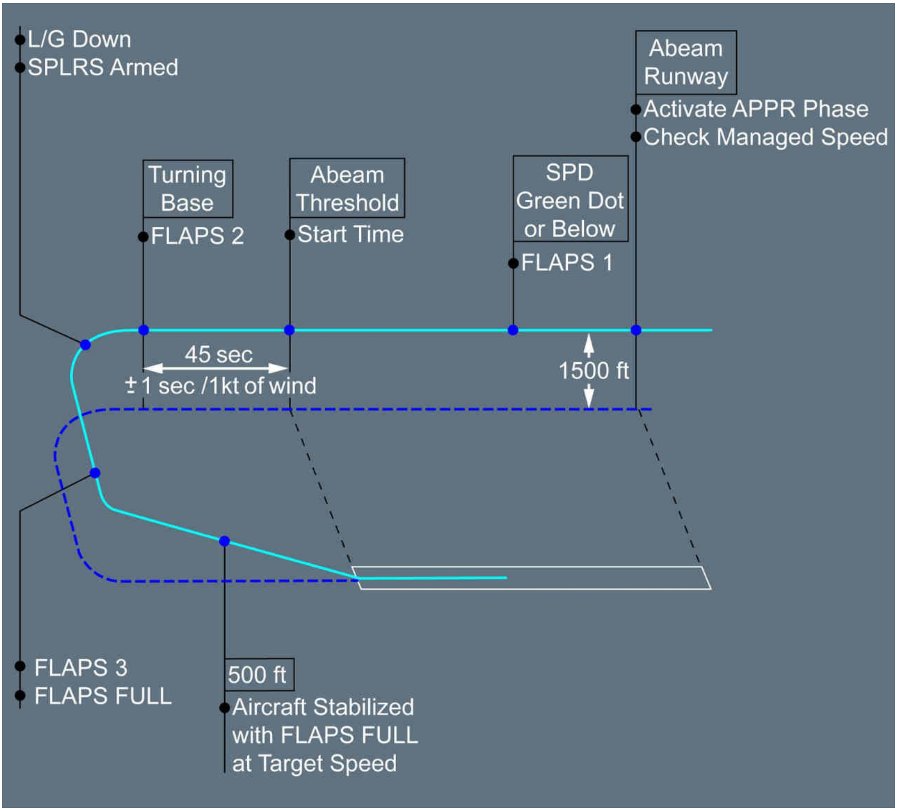
The speed trend arrow and FPV help the flight crew make timely and correct thrust settings (if in manual thrust), and approach path corrections.
Avoid descent through the correct approach path with idle thrust (Late recognition of this situation without a prompt thrust increase may lead to considerable speed decay and altitude loss).
Have the aircraft stabilized by 500 ft AGL, on the correct approach path at VAPP (or ground speed mini) with the appropriate thrust.
If the aircraft is not stabilized on the approach path in landing configuration at 500 ft above airfield elevation, or as restricted by Operator policy/regulations, a go-around must be initiated unless the flight crew estimates that only small corrections are necessary to rectify minor deviations from stabilized conditions due, amongst others, to external perturbations.
Avoid any tendency to “duck under” in the late stages of the approach.

Avoid destabilizing the approach in the last 100 ft to have the best chance of making a good touchdown at the desired position.

Ident.: PRO-NOR-SOP-180-C-E-00018968.0001001 / 06 AUG 14

VISUAL APPROACH PATTERN

The following approach pattern is based on the assumption that managed speed is used:



L/G Down
SPLRS Armed
Abeam Runway
Activate APPR Phase
Check Managed Speed
Turning Base
FLAPS 2
Abeam Threshold
Start Time
SPD Green Dot or Below
FLAPS 1
45 sec
± 1 sec /1kt of wind
1500 ft
FLAPS 3
FLAPS FULL
500 ft
Aircraft Stabilized with FLAPS FULL at Target Speed

If in selected speed, select:
- S speed after FLAPS 1 selection
- F speed after FLAPS 2 selection
- VAPP after FLAPS FULL selection.

RNAV VISUAL APPROACH

Applicable to: ALL

Ident.: PRO-NOR-SOP-180-C-F-00023237.0001001 / 04 MAY 16

GERERAL

The aircraft navigates using the RNAV system, but the position is monitored by visual reference to the ground, obstacles and other traffic.

RNAV visual approach must be stored and retrievable from the Navigation Database.

Ident.: PRO-NOR-SOP-180-C-F-00023239.0001001 / 04 MAY 16

AP/FD GUIDANCE MODE

- **If no required accuracy is published:**

  The use of AP/FD guidance mode is at flight crew discretion.

- **If RNAV 1 or RNP 1 is required on the published approach chart:**

  The flight crew should use adequate AP/FD guidance modes.

Note:
1. *The use of lateral and vertical managed guidance modes reduces the crew workload and improves energy management.*
2. *For RNAV VISUAL approach including Radius to Fix (RF) legs, Refer to FCTM/PR-NP-SOP-190-RF-LEG General for RF leg flying technic.*

Ident.: PRO-NOR-SOP-180-C-F-00023240.0001001 / 04 MAY 16

DESCENT PREPARATION

For approach data insertion in the FMS, keep the MINIMUM entry fields empty on the APPR panel of the FMS ACTIVE/PERF page.

Ident.: PRO-NOR-SOP-180-C-F-00023241.0001001 / 04 MAY 16

DESCENT

For RNAV visual approaches requiring GPS, check that NAV PRIMARY is available on at least 1 FMS.

Ident.: PRO-NOR-SOP-180-C-F-00023242.0001001 / 04 MAY 16

FINAL APPROACH

The flight crew must disconnect the AP at the latest at the minimum height for use of the AP.

L2 For minimum use height of AP, *Refer to Auto Flight System Limitations*.

LANDING

Applicable to: ALL

Ident.: PRO-NOR-SOP-210-A-00006718.0001001 / 30 MAR 17

FOR MANUAL LANDING

AP...OFF | PF

AROUND 40 FT RA

In stabilized approach, the flare height is approximately 40 ft.

FLARE...PERFORM | PF

L2 *For more information, Refer to FCTM/PR-NP-SOP-220 Flare and Touchdown.*

L1 ATTITUDE...MONITOR | PM

L2 *Rely on the "PITCH PITCH" auto callout for pitch monitoring.*
The PM announces “BANK BANK” if the bank angle goes above 6 °.

L1 THRUST LEVERS...IDLE | PF

L2 *Move the thrust levers to idle, and begin a gentle progressive flare to enable the aircraft to touch down without a prolonged float.*
If the autothrust is engaged, it automatically disconnects when all the thrust levers are set to idle detent.
At 20 ft, an automatic “RETARD” callout will trigger, as a reminder.

Note: *Ground spoilers extension is inhibited if one or more thrust levers remain above the IDLE detent.*

L1 DEROTATION

- **As soon as the main landing gear touches down:**
  DEROTATION...INITIATE | PF

Ident.: PRO-NOR-SOP-210-A-00006722.0001001 / 29 NOV 18

FOR AUTOMATIC LANDING

AT 350 FT RA

LAND ON FMA ....CHECK/ANNOUNCE | PF

L2 *If the FMA does not display LAND, perform a go-around, or a manual landing if visual references are sufficient.*

L1 ILS(GLS ◁) COURSE...CHECK | PF

L2 *If the ILS(GLS ◁) course pointer and the runway track differ by more than 5 °, perform a go-around, or a manual landing if visual references are sufficient.*

L1 **AT 200 FT RA, FOR ILS CAT III APPROACH WITHOUT DH**

- **If the flight crew did not detect any failure:**
  CONTINUE....................ANNOUNCE | PF

BETWEEN 50 FT AND 40 FT RA

FLARE ON FMA ....CHECK/ANNOUNCE | PM

L2 *If the FMA does not display FLARE, perform a go-around, or a manual landing if visual references are sufficient.*

L1 FLARE....................MONITOR | PF

L2 *For more information, Refer to FCTM/PR-NP-SOP-220 Flare and Touchdown.*

L1 **AT APPROXIMATELY 30 FT RA**

THR IDLE ON FMA ....CHECK | PM

L2 *The autothrust begins to decrease thrust to idle.*

L1 **AT 10 FT RA**

L2 An automatic "RETARD" callout triggers.

L1 THRUST LEVERS....................IDLE | PF

L2 *The autothrust disconnects.*

L1 LATERAL GUIDANCE....................MONITOR | PF

L2 *Monitor the lateral guidance by using external references.*

L1 **AT TOUCHDOWN**

ROLL OUT ON FMA ....CHECK/ANNOUNCE | PM

- **If AUTO ROLL OUT:**
  AP ....KEEP ON, UNTIL END OF ROLL OUT | PF

Ident.: PRO-NOR-SOP-210-A-00006725.0002001 / 08 JUL 19

LANDING ROLL

L2 For more information, *Refer to FCTM/PR-NP-SOP-220 Roll Out*.
For more information, *Refer to FCTM/Deceleration*.
For additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 ALL REVERSER LEVERS....................REV MAX or REV IDLE | PF

The flight crew must select reverse thrust immediately after main landing gear touchdown.

The flight crew must immediately select REV MAX, if any of the following occurs at any time during the landing:
- *An emergency*
- *The deceleration is not as expected*
- *A failure affects landing performance*
- *A long flare or a long touchdown*
- *An unexpected tailwind.*

A small pitch up may occur during thrust reversers deployment before nose landing gear touchdown. However, the flight crew can easily control this pitch up.
As soon as the flight crew selects reverse thrust, they must perform a full-stop landing.

GND SPLRS....................CHECK/ANNOUNCE | PM

L2 *Check the WHEEL page or slats/flaps display on the lower part of the PFD, to ensure that the ground spoilers are extended.*

If no ground spoilers are extended:
- *Check that all thrust levers are set to IDLE detent*
- *Set both thrust reverser levers to MAX REV, and fully press the brake pedals.*

Note: If ground spoilers are not armed, ground spoilers will extend at reverser thrust selection.

L1 REVERSERS....................CHECK/ANNOUNCE | PM

L2 *Check that the ED displays the expected reverser deployment (i.e. REV).*

L1 DIRECTIONAL CONTROL....................MONITOR/ENSURE | PF

L2
- *Monitor directional control, if the rollout is automatic*
- *Ensure directional control, if the rollout is manual. Use the rudder pedals for directional control*
- *During rollout, avoid sidestick inputs (either lateral or longitudinal)*
- *If the flight crew encounters directional control problems, they should reduce the thrust to REV IDLE until directional control is satisfactory.*

L1 *Do not use the nosewheel steering control handle before reaching taxi speed.*

- **If autobrake is selected:**

  AUTO BRK....................CHECK/ANNOUNCE | PM

L2 *Check and announce BTV, BTV CONTAM or BRK MED on the FMA.*

Note: If no ground spoilers are extended, the autobrake will not activate.

L1

WARNING	When landing on a contaminated runway with the autobrake: - BTV CONTAM or BRK MED must be displayed on the FMA - If BTV is displayed on the FMA, the flight crew must immediately apply pedal braking.

- **If landing without autobrake:**

  BRAKES.......... AS RQRD | PF

L2 *If required for performance reasons, braking may begin before the nosewheel touchdown. However, if passenger comfort is the priority, the flight crew should delay braking on dry runways only, until the nosewheel touches down.*

L1 DECELERATION.......... CHECK/ANNOUNCE | PM

L2 *The flight crew feels the deceleration. The flight crew checks the speed trend on the PFD to confirm the deceleration.*

Ident.: PRO-NOR-SOP-210-A-00006726.0001001 / 25 APR 14

AT 70 KT

L2 For Additional information on the associated standard callouts, *Refer to PRO-NOR-SCO Summary for Each Flight Phase*.

L1 SEVENTY KNOTS.......... ANNOUNCE | PM
ALL REVERSER LEVERS.......... IDLE | PF

CAUTION	*Avoid using high levels of reverse thrust at low speed, unless required due to an emergency. This distortion of the airflow caused by gases that re-enter the compressor can cause engine stalls that may result in excessive EGT.*

Ident.: PRO-NOR-SOP-210-A-00024557.0001001 / 04 APR 18

FOR CAT II & CAT III OPERATIONS WITH BTV

- **If the aircraft ground speed is more than 10 kt when the aircraft enters the last 300 m (1 000 ft) of the runway (i.e. the centerline runway lights are continuously red):**

  PEDAL BRAKING.......... APPLY AS RQRD | PF

Ident.: PRO-NOR-SOP-210-A-00006727.0001001 / 30 JUL 15

AT TAXI SPEED

ALL REVERSER LEVERS.......... STOW | PF

L2 *When the aircraft reaches the taxi speed, and before it leaves the runway, stow the reversers. Do not leave the thrust reverser levers in an intermediate position between REV IDLE and FWD IDLE for more than 10 s (to prevent partial stowage of the thrust reversers).*

In the case of partial stowage of the thrust reversers: If conditions permit, recycle the thrust reverser levers to REV IDLE again, then rapidly to FWD IDLE (in less than 10 s).

L1

CAUTION	*Except in an emergency, do not use reverse thrust to control the aircraft speed while on taxiways.*

L2 *On taxiways, the use of reversers, even restricted to idle thrust, may have the following effects:*

- *The engines may ingest fine sand and debris that may be detrimental to the engines and airframe systems*
- *On snow-covered areas, snow will recirculate into the air inlet, and may cause an engine flameout or rollback.*

L1 AUTO BRK..DISARM | PF

L2 *The autobrake may be disarmed at pilot's discretion.*
The flight crew should use one of the A/THR Instinctive Disconnect pb to disarm the autobrake.
If BTV is active and the flight crew did not disarm manually the autobrake, the autobrake disarms automatically at 10 kt.

L1 ● **If AUTO ROLL OUT:**

When vacating the runway:

AP..OFF

Intentionally left blank

GO-AROUND

Applicable to: ALL

Ident.: PRO-NOR-SOP-220-A-00006729.0001001 / 03 JUL 20

1 GO-AROUND INITIATION

L2 For additional information on the associated standard callouts:
- *Refer to PRO-NOR-SCO Summary for Each Flight Phase*
- *Refer to PRO-NOR-SCO Go-Around*.

L1 Simultaneously apply the following three actions:

THRUST LEVERS.. TOGA THEN FLX/MCT | PF

Set the thrust levers to the TOGA detent to ensure engagement of SRS GA mode. Then, set the thrust levers to FLX/MCT to engage the GA SOFT mode.
At any time, if TOGA thrust is desired, set the thrust levers to TOGA detent.

L2 *Note: If the thrust levers are not briefly set to the TOGA detent, the FMS does not engage the GO-AROUND phase, and when the aircraft flies over, or close to the airport (less than 7 NM) the FMS will sequence the destination waypoint in the F-PLN.*

L1 ROTATION...PERFORM | PF

L2 *Initiate the rotation toward a pitch attitude of 12.5 ° (10 ° if one engine is failed) to obtain a positive rate of climb, then follow the SRS pitch command bar.*
If the go-around is performed with Auto Pilot (AP) check pitch increase.

L1 *When near to the ground, avoid excessive rotation rate in order to prevent a tail strike.*

GO-AROUND.. ANNOUNCE | PF
FLIGHT PARAMETERS...MONITOR | PM

L2 *The PM must monitor flight parameters and announce any deviation. For additional information on the associated standard callouts, Refer to PRO-NOR-SCO Summary for Each Flight Phase.*

If the PM announces a flight parameter deviation, the appropriate PF response must:
- *Acknowledge the PM callout, for appropriate flight crew coordination*
- *Take immediate corrective action to bring the parameter back into the defined stabilized conditions.*

During an RNP AR Go-Around:
- *Monitor the LDEV displayed on PFDs and the XTK on the NDs.*

  Note: LDEV automatically appear when flying an RNP AR procedure. On the PFD, one dot equals to a 0.1 NM. On the NDs, the numerical value of the lateral deviation is displayed as soon as it exceeds 0.02 NM.

- *The LDEV value must be compared to the RNP for the active leg displayed on the F-PLN page or on the bottom of the NDs.*
- *The PM announces "LAT DEV" if excessive lateral deviation occurs: 1/2 dot.*
- *If XTK or LDEV increases toward the current RNP value, take over manually to fly back on the intended flight path and reengage AP as applicable.*

L1 FLAPS... RETRACT ONE STEP | PM
FMA...CHECK/ANNOUNCE | PF

If the FMA does not display MAN GA SOFT or MAN TOGA, immediately set the thrust levers to the TOGA detent.

NAV MODE	CHECK ENGAGED	

L2 *For RNP AR, NAV mode must be engaged immediately.*

ENG

- **No less than 5 min after high thrust operations:**

  ENG 1, 2 MASTER LEVERS....OFF | PF

L2 *Note: The flight crew must operate the engines at or near idle thrust for a cooling period of 5 min before engine shutdown, in order to thermally stabilize the engines.*

Idle reverse thrust and normal thrust to maneuver during taxi (i.e. at or near idle), are not considered as high thrust operations. Therefore, both of the following applies:
- *If the flight crew uses idle reverse thrust for landing and normal thrust to maneuver during taxi after landing, the cooling period starts when the flight crew retards the thrust lever during the flare*
- *If the flight crew uses maximum reverse for landing, the cooling period starts when the flight crew sets the thrust lever to idle reverse during the landing rollout.*

L1 ENGINE PARAMETERS....CHECK | PF

L2 *Check that engine parameters decrease.*

SECURING THE AIRCRAFT

Applicable to: ALL

Ident.: PRO-NOR-SOP-260-260-00006040.0001001 / 08 JUL 19

GENERAL

The flight crew should apply the following procedure as per company policy.
Airbus recommends performing the following procedure when the aircraft is left unattended: i.e. no qualified flight crew or ground crew are in the cockpit to supervise and monitor the aircraft systems.
If the aircraft is secured for cold soak: *Refer to PRO-NOR-SUP-SUP-ADVWXR Securing the Aircraft for Cold Soak*.

Ident.: PRO-NOR-SOP-260-260-00006042.0001001 / 18 JUN 15

COMMUNICATIONS AND STANDARD TERMS

Ident.: PRO-NOR-SCO-00020433.0001001 / 25 APR 14
Applicable to: ALL

Standard phraseology is essential to ensure an effective flight crew communication. The phraseology should be concise and exact. The following section lists the callouts that the flight crew should use as standard callouts. They supplement the callouts identified in the SOP. These standard Airbus callouts are also designed to promote situational awareness, and to ensure the flight crew understanding of systems and their use in line operation.

CHECKLIST CALLOUTS

Ident.: PRO-NOR-SCO-00020434.0001001 / 25 APR 14
Applicable to: ALL

- “CHECK” is a command for the other flight crewmember to check an item
- “CHECKED” is a response to indicate that an item is checked
- “CROSSCHECKED" is a callout verifying information from both flight crew's stations.

If a checklist needs to be interrupted, announce “HOLD CHECKLIST AT ___”.
Announce “RESUME CHECKLIST AT ___” for the continuation of the checklist.
After a checklist is completed, announce “__CHECKLIST COMPLETE”.

ACTIONS COMMANDED BY PF

Ident.: PRO-NOR-SCO-00020435.0001001 / 14 JUN 16
Applicable to: ALL

The following commands do not necessarily initiate a guidance mode change, e.g. selected to managed, or managed to selected. The intent is to ensure clear, consistent, and standard communication between crewmembers. All actions performed on the AFS CP and FMS must be checked on the PFD and ND: E.g. “FL 350 blue”, “FL 200 magenta”. The flight crew should ensure that the correct AFS CP control is used, then verify the indications on the PFD/ND.

"SET"

The “SET” command means using an AFS CP knob to set a value, but not to change a mode. "SET" is performed by only rotating the appropriate knob.

Examples:
- ”SET GO AROUND ALTITUDE__FT”
- ”SET QNH __”
- “SET FL __”
- “SET HDG __”.

"MANAGE/PULL"

The “MANAGE” command means pushing an AFS CP knob to engage, or arm, a managed mode or target.
The “PULL” command means pulling an AFS CP knob to engage a selected mode or target.

Examples:
- “PULL HDG 090”: The flight crew pulls and turns the HDG/TRK knob
- "MANAGE NAV": The flight crew pushes the HDG/TRK knob
- “FL 190 PULL”: The flight crew turns and pulls the ALT knob
- “FL 190 MANAGE”: The flight crew turns and pushes the ALT knob
- “PULL SPEED 250 kt ”: The flight crew pulls and turns the SPD/MACH knob
- “MANAGE SPEED”: The flight crew pushes the SPD/MACH knob.

Note: *If the value was previously set, there is no requirement to repeat the figure. Simply announce e.g. "PULL HDG", "PULL SPEED", "FL PULL".*

The V/S / FPA knob has no managed function. The standard callouts for the use of this knob are the following:
- "V/S Plus(Minus) 700 PULL", or
- "FPA Minus 3 ° PULL": The flight crew turns and pulls the V/S / FPA knob, or
- "PUSH TO LEVEL OFF": The flight crew pushes the V/S / FPA knob.

"PRESS ALT"

The ALT pb enables to immediately start a level off. The standard callout for the use of the ALT pb is "PRESS ALT".

"ARM"

The “ARM __” command means arming a system by pushing the specified AFS CP control.

Examples:
- “ARM APPROACH”
- “ARM LOC.”

"ON/OFF"

The simple "ON" or "OFF" command is used for the autopilot, the flight director, the A/THR and the bird (flight path vector). E.g.: BIRD ON (The flight crew pushes the HDG-V/S / TRK-FPA pb to select the TRK-FPA flying reference).

FMA

Ident.: PRO-NOR-SCO-00020436.0001001 / 25 APR 14
Applicable to: ALL

The PF should announce any FMA change, unless specified differently (e.g. CAT II & III task sharing).

Therefore, the PF should announce:
- All armed modes with their associated color (e.g. blue, magenta): E.g. “G/S blue”, “LOC blue”
- All active modes without their associated color (e.g. green, white): E.g. “NAV”, “ALT”.

The PM should check and respond “CHECKED” to all FMA changes announced by the PF.

ALTITUDE

Ident.: PRO-NOR-SCO-00020437.0001001 / 25 APR 14
Applicable to: ALL

The PM announces “ONE THOUSAND TO GO” when passing 1 000 ft before the cleared altitude or FL, and the PF announces “CHECKED”.

FLAPS OR GEAR CONFIGURATION

Ident.: PRO-NOR-SCO-00020438.0001001 / 07 MAY 18
Applicable to: ALL

FLAPS CALLOUTS

FLAPS Configuration	Callout
1	"FLAPS ONE"
1+F	"FLAPS ONE"
0	"FLAPS ZERO"

The flight crewmember replies the following callout when they select the new FLAPS position, e.g.:

	Callout	Remark
PF	″FLAPS ONE″	
PM	″SPEED CHECKED″	The PM checks that the speed is: - Above S or F speed and accelerating, during takeoff - Below VFE next and decelerating during approach.
	″FLAPS ONE″	The PM selects the FLAP lever position. The PM checks the blue FLAPS lever position on the PFD to confirm the correct selection, then replies.

GEAR CALLOUTS

	Callout	Remark
PF	˝GEAR UP(DOWN)˝	
PM	˝GEAR UP(DOWN)˝	The PM selects the landing gear lever position. The PM checks the landing gear indication on the PFD to confirm the landing gear operation, then replies.

FLIGHT PARAMETERS

Applicable to: ALL

Ident.: PRO-NOR-SCO-FLP-00020439.0001001 / 03 JUL 20

1 ## APPROACH

The PM announces:
- “SPEED” if the speed goes below the speed target -5 kt, or goes above the speed target +10 kt
- “SINK RATE” if the descent rate goes above 1 200 ft/min
- “BANK” if the bank angle goes above 6 °
- “PITCH” if the pitch attitude goes above 10 °, or below 0 °
- "LOC” if the LOC, F-LOC or LOC B/C deviation goes above ½ dot
- “GLIDE” if G/S or F-G/S deviation goes above ½ dot
- "CROSS TRACK" if the XTK goes above 0.1 NM
- “COURSE” if the course goes above ½ dot or 2.5 ° (VOR) or 5 ° (ADF ◁✱)
- "__ FT HIGH(LOW)” at altitude checks point.

RNAV(RNP) APPROACH:

The PM announces:
- "LAT DEV" if excessive lateral deviation occurs: ½ dot
- "VDEV" if excessive vertical deviation occurs: -50 ft or ½ dot below.

Ident.: PRO-NOR-SCO-FLP-00024212.0001001 / 30 MAR 17

LANDING

Rely on the "PITCH PITCH" auto callout for pitch monitoring.
The PM announces “BANK BANK” if the bank angle goes above 6 °.

Ident.: PRO-NOR-SCO-FLP-00020440.0001001 / 30 MAR 17

GO-AROUND

The PM announces:
- “PITCH”, if the pitch attitude goes above 20 ° up, or below 10 ° up
- “BANK”, if the bank angle goes above 6 °
- “SINK RATE”, if there is no climb rate.

PF/PM DUTIES TRANSFER

Ident.: PRO-NOR-SCO-00020441.0001001 / 25 APR 14
Applicable to: ALL

Both flight crewmembers must use the following callouts in order to transfer the controls:
To give control: The PF announces “YOU HAVE CONTROL”. The other flight crewmember accepts this transfer by announcing “I HAVE CONTROL”, before assuming the PF duties.
To take control: The PM announces “I HAVE CONTROL”. The other flight crewmember accepts this transfer by announcing “YOU HAVE CONTROL”, before assuming the PM duties.

SUMMARY FOR EACH FLIGHT PHASE

Ident.: PRO-NOR-SCO-00020442.0001001 / 08 JUL 19
Applicable to: ALL

To Remove the External Power Units

Continued from the previous page

Approach and Landing		
Event	**PF**	**PM**
1 000 ft RA	CHECKED	ONE THOUSAND (2)
100 ft above MDA/DH	CHECKED	ONE HUNDRED ABOVE (2)
Visual references at MDA/DH	CONTINUE	MINIMUM (2)
No visual reference at MDA/DH	GO AROUND - FLAPS	MINIMUM (2)
		ONE HUNDRED (2) FIFTY (2)
After touchdown Ground spoilers extended REV on ED		SPOILERS (3) REVERSE GREEN (4)
Deceleration		DECEL (5)
At 70 kt	CHECKED	SEVENTY KNOTS

(1) *Crew awareness: The flight crew should now keep RA in scan to landing.*

(2) *The PM monitors the pin-programmed auto callouts, or announces if they are inoperative.*

(3) *If the spoilers are not extended, announce "NO SPOILER".*

(4) *If the reverse deployment is not as expected, announce "NO REVERSE ENGINE_" or "NO REVERSE", as appropriate.*

(5) *In the case of failure or no positive deceleration: "NO DECEL"*
"DECEL" callout means that the deceleration is felt by the flight crew, and confirmed by the speed trend on the PFD. It can also be confirmed by the DECEL indication on the PFD, if the autobrake is active.
However, the DECEL indication appears when the current deceleration reaches 80 % of the selected deceleration rate. Therefore it is not an indication of the correct autobrake functioning, but it indicates that the deceleration rate is reached. E.g. the DECEL indication may not appear on a contaminated runway, with the autobrake active, due to the effect of the anti-skid.

AIRFRAME DEICING/ANTI-ICING PROCEDURE ON GROUND

Ident.: PRO-NOR-SUP-SUP-ADVWXR-00019560.0001001 / 03 JUL 20
Applicable to: ALL

L2 This procedure is applicable at the gate or at the deicing bay. Specific actions linked to the engine status (running or not) are mentioned when required.

1 L1

CAUTION	If possible, avoid APU operation during aircraft deicing/anti-icing. APU operation during aircraft deicing/anti-icing may result in deicing/anti-icing fluid ingestion and cause damage to the APU.

- **BEFORE FLUID SPRAYING:**

DOORS....................CHECK CLOSED
COM WITH GND PERSONNEL....................ESTABLISH
PARK BRK....................ON
ENG BLEED 1+2....................OFF
APU BLEED....................OFF
DITCHING pb ....ON

L3 *Setting the DITCHING pb-sw to ON closes the following:*
- *The outflow valves*
- *The avionics overboard valve*
- *Both pack valves*
- *All the cargo isolation valves*
- *The pack ram air inlets and outlets*
- *The emergency RAM air inlet.*

L2 *This prevents the deicing fluid from entering the aircraft.*
The avionics ventilation remains available, when the avionics ventilation blowing fans are operative.

L1 REC MAX TIME WITHOUT AIR COND: 30 MIN

L2 *On ground, with passengers on board, it is recommended not to exceed 30 min without air conditioning, because comfort may be affected.*

L1
- **When the aircraft is ready for spraying:**

FLUID SPRAYING....................REQUEST

- **AFTER FLUID SPRAYING:**

DITCHING pb ....OFF
OUTFLOW VALVES....................CHECK OPEN

L2 *To avoid any unexpected pressurization, check on the CAB PRESS SD page that both outflow valves are open.*

L1 ● **At least 1 min after fluid spraying:**

ENG BLEED 1+2..ON

● **At least 5 min after fluid spraying:**

APU BLEED..AS RQRD

L2 *Note: There is a risk of fluid ingestion by the APU air intake resulting in odors or smoke alerts. Therefore, the flight crew should consider a takeoff with APU bleed off.*

L1 PROBE & WINDOW HEAT pb ....AUTO
PITOTS AND STATICS (GROUND CREW)..CHECK
GROUND EQUIPMENT..CHECK REMOVED

L2 *After deicing is completed, request the ground personnel to confirm that the aircraft is clear from any ground equipment.*

L1 DEICING/ANTI-ICING REPORT..RECEIVED

L2 *The information from the ground personnel who performed the deicing/anti-icing, and the post-application check must include:*
- *The type of fluid used*
- *The ratio of fluid to water (e.g. 75/25)*
- *The time of the holdover beginning*
- *The result of the post-application check: “Aircraft critical parts are clean”.*

L1 ● **IF ENGINES NOT RUNNING:**

SOP — BEFORE START..RESUME

L2 *For a detailed description of the Before Start SOP, Refer to procedure.*

L1 ● **IF ENGINES RUNNING:**

GND SPLRS..ARM
RUDDER TRIM..NEUTRAL
FLAPS..SET

L2 *If taxiing in icing conditions with rain, slush, or snow, maintain the slats/flaps retracted until the aircraft reaches the holding point of the takeoff runway, in order to prevent contamination of the slats/flaps mechanism. Delay flight controls check accordingly. The flight crew should perform the flight controls check in the flaps configuration for takeoff.*

L1 FLIGHT CONTROLS..CHECK

L2 *In freezing precipitation, perform the appropriate checks to evaluate aircraft icing. The decision on whether to take off, or to deice again the aircraft, depends on the amount of ice that has built up on the critical surfaces since the last deicing. Make an inspection from the inside and outside the aircraft before the holdover time expires, or just before takeoff.*

L1 AFTER START CHECKLIST.. COMPLETE

L2 *If taxiing in icing conditions with rain, slush, or snow, delay BEFORE TAKEOFF C/L until the aircraft reaches the holding point of the takeoff runway.*

L1 SOP — TAXI... RESUME

L2 *For a detailed description of the Taxi SOP, Refer to procedure.*

COLD WEATHER PROCEDURES

Applicable to: ALL

Ident.: PRO-NOR-SUP-SUP-ADVWXR-A-00019462.0001001 / 03 SEP 14

DURING SAFETY EXTERIOR INSPECTION

WINDSHIELD/UPPER COCKPIT FUSELAGE................	CLEAR OF ICE AND SNOW	CM2
APU AIR INTAKE..	CLEAR OF ICE AND SNOW	CM2
PACK RAM AIR INLET AND PACK RAM AIR OUTLETS..	CLEAR OF ICE AND SNOW	CM2
OUTFLOW VALVES..	CLEAR OF ICE AND SNOW	CM2

Ident.: PRO-NOR-SUP-SUP-ADVWXR-A-00019492.0001001 / 03 SEP 14

DURING PRELIMINARY COCKPIT PREPARATION

CAUTION	With ice or snow accumulated on the windshield/upper cockpit fuselage, and if the PROBE/WINDOW HEAT is turned on, melted snow running down from the cockpit windows could re-freeze on the fuselage area below, when the temperature is very low. This could create ice build up on the forward fuselage that could possibly disturb the airflow around the static/MFP probes.

PROBE & WINDOW HEAT pb-sw..ON | CM2

L2 *When no engine is started, window heating operates when the PROBE/WINDOW HEAT pb-sw is set to ON.*

Ident.: PRO-NOR-SUP-SUP-ADVWXR-A-00019524.0001001 / 06 JUN 18

DURING EXTERNAL WALKAROUND

SURFACES..CLEAR OF FROST, ICE AND SNOW | PM

L2 *Critical surfaces must be cleared of frost, ice, and snow:*
- *Leading edges and upper surfaces of the wings*
- *Vertical and horizontal stabilizers*
- *All control surfaces*
- *Slats and flaps*
- *Lower part of the nose fuselage.*

L1 MAX 3 MM OF FROST ON LOWER SIDE OF WING TANK AREA

L2 *Thin hoarfrost is acceptable on the upper surface of the fuselage. On the lower side of the wing tank area, a layer of frost thinner than 3 mm does not penalize aircraft performance during takeoff.*

L3 *Note:* *Thin hoarfrost is a white crystalline deposit that develops uniformly on the exposed aircraft surfaces during cold and cloudless nights. Below the hoarfrost layer, it is possible to distinguish the surface features (e.g. lines or markings).*

L1 EQUIPMENT..CLEAR OF FROST, ICE AND SNOW | PM

L2 *Critical equipment must be cleared of frost, ice, and snow:*
- *Landing gear equipment: Lever locks, tires, and landing gear doors*
- *Engine inlets, inlet lips, fans (check that the fans can rotate), spinners, fan exhaust ducts, reverser equipment*
- *Drains, bleeds, probes, (pitots, static ports, TAT sensors, angle-of-attack sensors)*
- *Fuel tank ventilation*
- *Radome*
- *Air/hydraulic heat exchanger inlet*
- *Commercial water supply must not be frozen, and must have been refilled.*

L1 ● **IF DEICING/ANTI-ICING REQUIRED AND PERFORMED AT THE GATE:**

SOP — COCKPIT PREPARATION...PERFORM

L2 *For a detailed description of the Cockpit Preparation SOP, Refer to procedure.*

L1 AIRFRAME DEICING/ANTI-ICING PROCEDURE ON GROUND.... *REFER TO PROC APPLY*

SOP — BEFORE START..RESUME

L2 *For a detailed description of the Before Start SOP, Refer to procedure.*

Ident.: PRO-NOR-SUP-SUP-ADVWXR-A-00019774.0001001 / 03 DEC 15

AFTER START

PROBE & WINDOW HEAT pb-sw ....AUTO | PF

L2 *When at least one engine is started, window heating operates under automatic control.*

L1 ● **IF TAXI TO A DEICING BAY REQUIRED:**

GND SPLRS: DO NOT ARM UNTIL ACFT DEICED

L2 *The ground spoilers can only be armed, when the aircraft is thoroughly deiced.*

L1 RUDDER TRIM: DO NOT MOVE UNTIL ACFT DEICED

L2 *The flight controls can only be moved, when the aircraft is thoroughly deiced.*

L1 FLAPS LEVER: DO NOT MOVE UNTIL ACFT DEICED

L2 *The flight controls can only be moved, when the aircraft is thoroughly deiced.*

L1 FLIGHT CONTROL SURFACES: DO NOT MOVE UNTIL ACFT DEICED

L2 *The flight crew must not perform the flight controls check until the aircraft is thoroughly deiced.*

L1 AFTER START C/L: DELAY UNTIL ACFT DEICED

L2 *Delay the AFTER START checklist until the aircraft is thoroughly deiced.*

L1
- **AT THE DEICING BAY:**

AIRFRAME DEICING/ANTI-ICING PROCEDURE ON GROUND.... *REFER TO PROC APPLY*
NORMAL SOP.. RESUME

OPERATIONS IN ASH, SAND OR DUST

Applicable to: ALL

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00021704.0001001 / 09 MAR 16

L2 In the case of volcanic ash encountered in flight,*Refer to procedure*.

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00006953.0001001 / 15 APR 19

DURING PRELIMINARY COCKPIT PREPARATION

APU : AVOID USE

L2 Request ground power for air conditioning and electricity. If ground power is not available, the APU should be used only to start the engines.

L1 WINDSHIELD WIPERS : AVOID USE

L2 Avoid the use of windshield wipers to remove volcanic ash or any particles.

L1 COOLG.. AS RQRD

L2 *Consider to set the supplemental cooling system to OFF, in order to avoid contamination of the heat exchangers.*

L1
- **For takeoff performance:**

BRAKING PERFORMANCE MAY BE DEGRADED

L2 A layer of volcanic ash, sand or dust on the runway may degrade the braking efficiency.

L1 PACK 1+2.. AS RQRD

L2 *Consider to set the packs to OFF in order to avoid contamination of the air conditioning system.*

L1 REC MAX TIME WITHOUT AIR COND: 30 MIN

L2 *On ground, with passengers on board, it is recommended not to exceed 30 min without air conditioning, because comfort may be affected.*

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00006954.0001001 / 07 MAY 18

DURING EXTERIOR WALKAROUND

SURFACES AND EQUIPMENT..CHECK FREE OF DEPOSITS

L2 *The ground crew must remove volcanic ash, sand or dust from lubricated surfaces, windshield, and must remove all deposits that could:*

- *Penetrate seals*
- *Enter the engine gas path, air conditioning system, air data probes, access doors and panels, and other openings on the aircraft.*

L1 ENGINE/APU INLETS.. CHECK FREE OF DEPOSITS

L2 *Inspect the inlets, and make sure that the ground crew removes all deposits. The ground crew should also remove the deposits from the area that is within 25 ft (8 m) of the engine inlets.*

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00006956.0001001 / 02 MAR 18

ENGINE START

ALL ENGINES..CRANK

L2 *Before engine start, ventilate all engines for 2 min by dry-cranking at the maximum motoring speed to remove any deposit from the booster area.*

L1 ■ **If air start unit is available:**

ENGINE START WITH AN AIR START UNIT................................. *REFER TO PROC APPLY*

■ **If air start unit is not available:**

SOP - ENGINE START...PERFORM

L2 For a detailed description of the Engine Start SOP, *Refer to procedure*.

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00006957.0001001 / 29 NOV 18

TAXI

ONE ENGINE TAXI: DO NOT PERFORM

L2 Taxi with both engines running. Minimize thrust during taxi.

L1 ENG 1 BLEED...OFF
ENG 2 BLEED...OFF

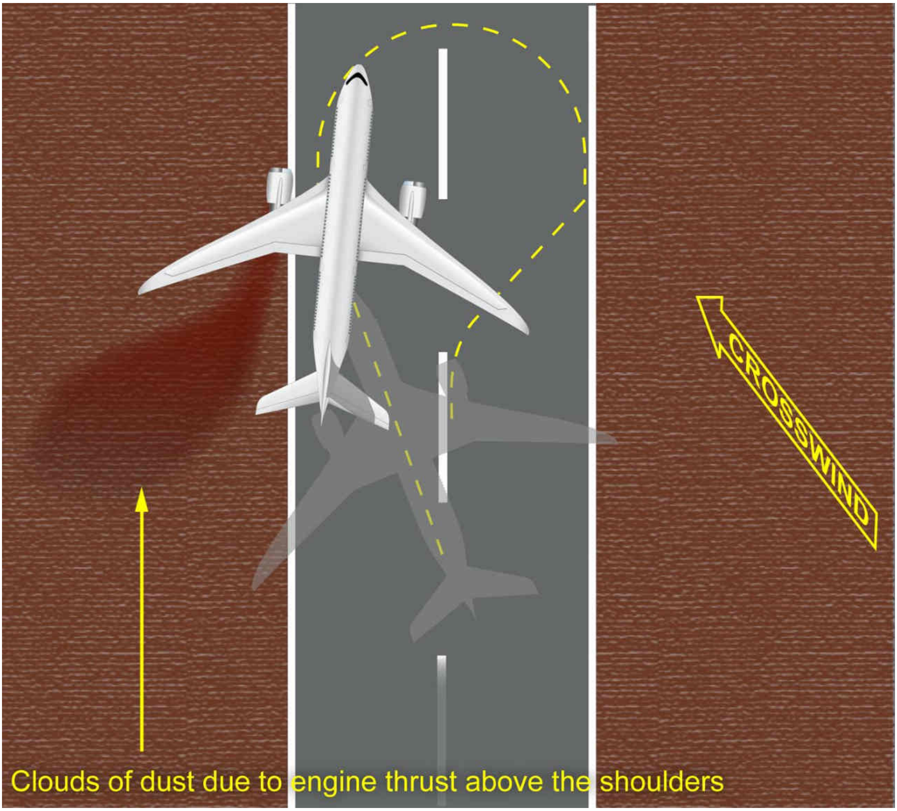
L2 *Keep the engine bleed valves closed during taxi, particularly in volcanic ash conditions.*

L1 TAXI WITH CARE
FOR 180° TURN ON RWY : INITIATE THE TURN DOWNWIND

L2 In order to prevent ash, sand or dust ingestion.

L1

180 Degrees Turn



CROSSWIND
Clouds of dust due to engine thrust above the shoulders

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00006958.0001001 / 09 MAR 16

TAKEOFF

ROLLING TAKEOFF.....CONSIDER

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00021826.0001001 / 09 MAR 16

AFTER TAKEOFF

ENG 1 BLEED.....ON
ENG 2 BLEED.....ON
COOLG.....AUTO
MINIMIZE TIME IN SAND OR DUST CLOUD

L2 If possible, adapt trajectory (route and altitude) to quickly exit from the cloud. In particular, altitude constraints may be disregarded in coordination with ATC.

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00023279.0001001 / 09 MAR 16

IN FLIGHT

AVOID ASH, SAND OR DUST CLOUD

- **If sand or dust cloud encounter:**

  MINIMIZE TIME IN SAND OR DUST CLOUD

  L2 If possible, adapt trajectory (route and altitude) to quickly exit from the cloud. In particular, altitude constraints may be disregarded in coordination with ATC.

L1
- **If volcanic ash encounter:**

  VOLCANIC ASH ENCOUNTER.. *REFER TO PROC APPLY*

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00021230.0001001 / 09 MAR 16

DESCENT PREPARATION

SOP — DESCENT PREPARATION...PERFORM

AUTOLAND RECOMMENDED

L2 Deposits on the windshield and on the landing lights may significantly reduce the flight crew's visibility during approach and landing. Therefore, consider a diversion to an airport where an autoland is possible.

L1 BTV : DO NOT USE

BRK MED RECOMMENDED

- **For landing performance:**

  BRAKING PERFORMANCE MAY BE DEGRADED

  L2 A layer of volcanic ash, sand or dust on the runway may degrade the braking efficiency. Adjust the RWY COND / BRK ACTION knob-selector accordingly.

  L1 FOR LDG : CONSIDER IDLE REV

  L2 Consider a possible limited use of the thrust reversers at landing.

L1 SOP — DESCENT PREPARATION.. RESUME

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00023281.0001001 / 09 MAR 16

DESCENT

AVOID LEVEL FLIGHT IN ASH, SAND OR DUST CLOUD

L2 If possible, perform holding patterns, and last level off before final descent, outside the cloud.

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00006959.0001001 / 03 JUL 20

2 LANDING

- **Before landing:**
  ENG 1 BLEED.......... OFF
  ENG 2 BLEED.......... OFF

L2 *Keep the engine bleed valves closed. Packs will close automatically if APU Bleed is OFF.*

L1 COOLG.......... AS RQRD

L2 *Consider to set the supplemental cooling system to OFF in order to avoid contamination of the heat exchangers.*

L1 PACK 1+2.......... AS RQRD

L2 *Consider to set the packs to OFF in order to avoid contamination of air conditioning system.*

L1 REC MAX TIME IN FLT WITHOUT AIR COND: 10 MIN

L2 *In flight, with passengers on board, it is recommended not to exceed 10 min without air conditioning, because comfort may be affected.*

L1
  - **If a Go-Around is performed:**
    ENG 1 BLEED.......... ON
    ENG 2 BLEED.......... ON

- **During landing roll:**
  ALL REVERSER LEVERS.......... AS RQRD

L2 *If maximum reverse thrust is necessary, apply reverse thrust at Main Landing Gear (MLG) touchdown. Limit the use of thrust reversers as much as possible, because the reverse air flow can stir the volcanic ash, sand, or dust, and reduce visibility.*

L1 REC MAX TIME WITHOUT AIR COND: 30 MIN

L2 *On ground, with passengers on board, it is recommended not to exceed 30 min without air conditioning, because comfort may be affected.*

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00021465.0001001 / 29 NOV 18

AFTER LANDING

APU : AVOID USE

L2 Request ground power for air conditioning and electricity.

L1 ONE ENGINE TAXI : DO NOT PERFORM

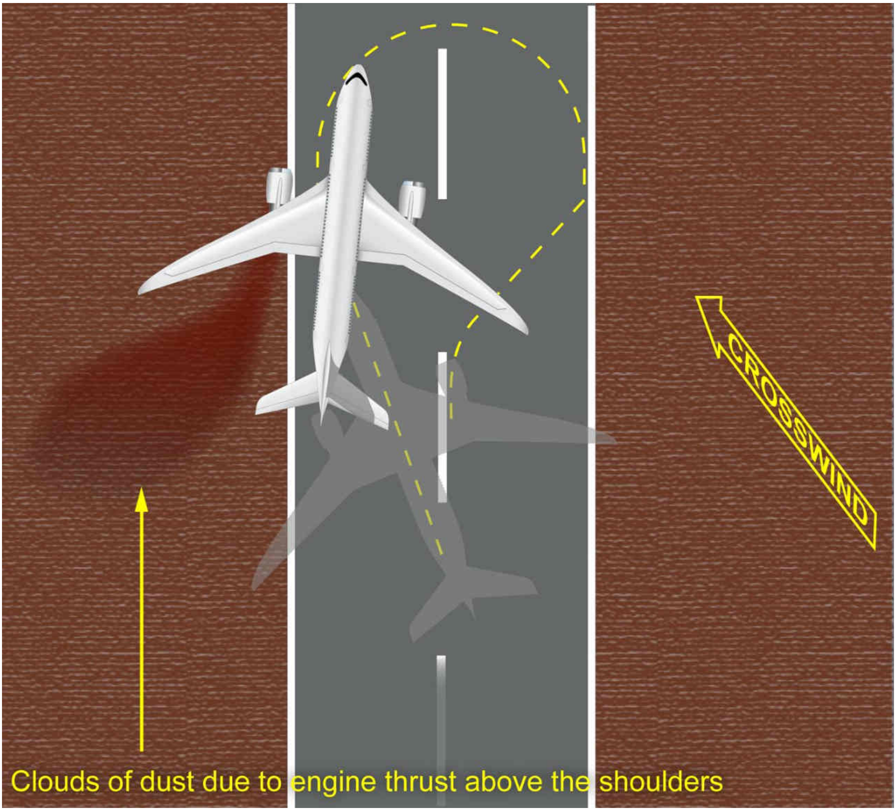
L2 Taxi with both engines running. Minimize thrust during taxi.

L1 TAXI WITH CARE

FOR 180° TURN ON RWY : INITIATE THE TURN DOWNWIND

L2 In order to prevent ash, sand or dust ingestion.

180 Degrees Turn



CROSSWIND
Clouds of dust due to engine thrust above the shoulders

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00023259.0001001 / 09 MAR 16

PARKING

LOGBOOK..REPORT ASH, SAND OR DUST CLOUD ENCOUNTER

L2 *Maintenance action is due.*

Ident.: PRO-NOR-SUP-SUP-ADVWXR-B-00006960.0001001 / 07 MAY 18

SECURING THE AIRCRAFT

- **When APU bleed is OFF:**

  DITCHING pb-sw.. ON

L2 *When set to ON, several valves will close, in order to isolate the aircraft from volcanic ash, sand, or dust ingestion.*

L1
- **When all batteries are OFF:**

  DITCHING pb-sw.. OFF

L2 *All the applicable valves will open, at the next power-up.*

L1 PROTECTIVE COVERS INSTALLATION.. REQUEST

L2 *Request ground crews to install protective covers and plugs in order to protect the aircraft from the ash, sand or dust.*

ENGINE OPERATION ON GROUND IN FZFG

Ident.: PRO-NOR-SUP-SUP-ADVWXR-00021364.0001001 / 29 JAN 19
Applicable to: ALL

INTRODUCTION

CAUTION	During taxi in freezing fog (FZFG) conditions, for temperatures below +1 °C (34 °F), ice accretion may affect the fan and core engine parts. Apply the below procedure to prevent potential engine damage.

The purpose of the procedure is to check that the expected taxi time does not exceed the maximum permitted taxi time in FZFG conditions.
For more information, *Refer to LIM-ENG Maximum Taxi Time in FZFG conditions*

PRELIMINARY COCKPIT PREPARATION

TOTAL TAXI TIME IN FZFG..DETERMINE

L2 *The total taxi time is the sum of :*

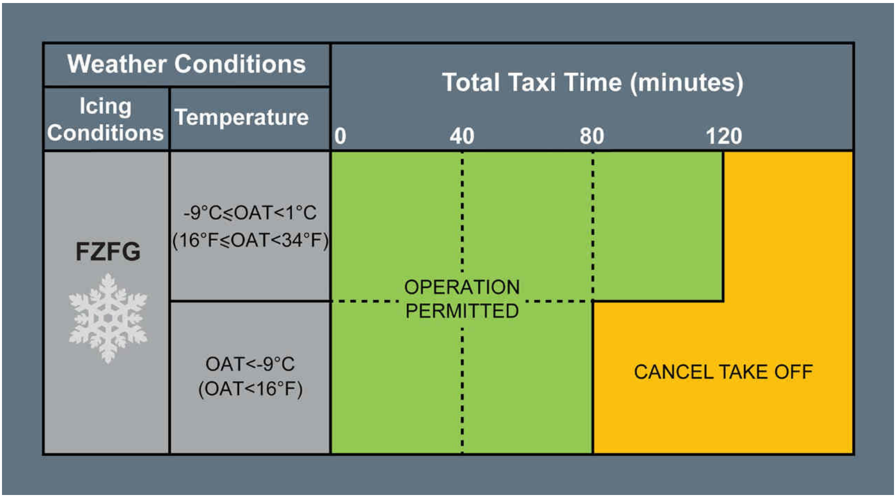
- *The taxi-in time of the previous flight, if performed in freezing fog conditions. It has to be taken into account only if the maintenance crew did not inspect engine icing and/or did not manually deice the engine after the taxi-in.*
- *The taxi-out time of the current flight. It is recommended to estimate this duration with the ATC.*

L1 MAXIMUM TAXI-OUT TIME IN FZFG..CHECK

L2 *The flight crew can consult the following table to check the Maximum Taxi-out time in FZFG according to the expected total taxi time determined in the previous step.*

If the OAT between taxi-in and taxi-out phases varies, i.e. the temperature in FZFG conditions increases or decreases, the most penalizing temperature limitation listed in the table below must be applied by the flight crew.

L1



Weather Conditions
Icing Conditions
Temperature
Total Taxi Time (minutes)
0
40
80
120
FZFG
-9°C≤OAT<1°C
(16°F≤OAT<34°F)
OAT<-9°C
(OAT<16°F)
OPERATION PERMITTED
CANCEL TAKE OFF

DURING TAXI-OUT

TAXI TIME...MONITOR

L2 *Monitor the taxi time to determine when the Maximum Taxi-out time is exceeded.*

L1

- **When Total taxi-time in FZFG conditions is exceeded or** ENG 1(2) STATOR A-ICE VLV CLOSED **alert is displayed on the WD:**

  TAKEOFF...CANCEL

  [LOGBOOK] PROCEDURE...RECORD

L2

Maintenance action is due in accordance with the "Cold Weather Maintenance - Maintenance Practice to Manually Deice the Core Engine" section of the Aircraft Line Maintenance - Maintenance procedure, to:

- Inspect the Variable Inlet Guide Vanes (VIGV) for ice,
- If necessary, manually deice the core engine.

L1 **PARKING**

- **If taxi-in in FZFG conditions:**

  [LOGBOOK] FZFG TAXI-IN TIME....................RECORD

L2 *Record in the logbook the taxi-in time performed in freezing fog (FZFG) conditions, in order to determine the remaining allowed taxi-out time in foreseen FZFG conditions.*

FLIGHT IN ICING CONDITIONS

Ident.: PRO-NOR-SUP-SUP-ADVWXR-00021107.0001001 / 27 FEB 17
Applicable to: ALL

CAUTION	The flight crew should avoid extended flight in icing conditions with the slats extended.

- **WHEN ICING CONDITIONS ARE ANTICIPATED OR ENCOUNTERED:**

L2 For more information about icing conditions, *Refer to GEN Definitions*.

L1 ENGINE ANTI-ICE....................ON

L2 *ENGINE ANTI-ICE must be ON during all ground and flight operations, when icing conditions exist or are anticipated, except during climb and cruise when the SAT is below -40 °C.*
ENGINE ANTI-ICE must be ON before and during a descent in icing conditions, even if the SAT is below -40 °C.

L1 ● **WHEN ICING CONDITIONS ARE ENCOUNTERED:**

■ **IF EVIDENCE OF ICE ACCRETION:**

WING ANTI-ICE....................ON

L2 *The flight crew must turn on the wing anti-ice if there is evidence of ice accretion, such as ice on the visual indicators or on the wipers, or if the alert A-ICE SEVERE ICE DETECTED is displayed. This is to remove any ice accumulation from the wing leading edge.*

L1 ■ **IF CONF CLEAN:**

MIN SPEED : GREEN DOT

■ **IF CONF 3 OR FULL:**

MIN SPEED : VLS + 5

L2 *The minimum speeds take into account ice accretion on non-heated structure, and on de-iced parts of the airframe when anti-ice is inoperative.*

L1 ■ **IF NO EVIDENCE OF ICE ACCRETION:**

WING ANTI-ICE..AS RQRD

L2 *The flight crew may turn on the wing anti-ice to prevent ice accretion on the wing leading edge*

SECURING THE AIRCRAFT FOR COLD SOAK

Ident.: PRO-NOR-SUP-SUP-ADVWXR-00019882.0001001 / 03 JUL 20
Applicable to: ALL

3

Cold soak should be considered in the following conditions:

- The OAT is less than 0 °C (32 °F), and
- No electrical supply and no air conditioning are provided to the aircraft, and
- The temperatures of the aircraft components decrease below 0 °C (32 °F).

WHEN SECURING THE AIRCRAFT

● **After switching off all bleeds, and before switching off the AC power:**

DITCHING pb-sw..ON

L3 *Setting the DITCHING pb-sw to ON closes the following:*

- *The outflow valves*
- *The avionics overboard valve*
- *Both pack valves*
- *All the cargo isolation valves*
- *The pack ram air inlets and outlets*
- *The emergency RAM air inlet.*

L2 *This protects the aircraft from the cold outside temperatures.*

L1 ● **When the chocks are in place:**

PARKING BRAKE..OFF

L2 *When the OAT is below -30 °C, hydraulic fluid may spill, if the parking brakes are pressurized.*

L1 ● **After switching off the batteries:**

DITCHING pb-sw..OFF

L2 *All the applicable valves will open at the next power up.*

L1 PROTECTIVE COVERS INSTALLATION..REQUEST

L2 *Request ground crews to install protective covers and plugs, in order to protect the aircraft wheels and the engines from snow and ice.*

L1 WATER SYSTEM DRAINING..REQUEST

L2 *Request maintenance actions to drain water system, for cold soak prevention purposes.*

Intentionally left blank

CROSSBLEED ENGINE START

Applicable to: ALL

Ident.: PRO-NOR-SUP-SUP-ENG-A-00021227.0001001 / 29 JAN 19

ENGINE START

- **Before second engine start:**

CAUTION	The simultaneous use of engine bleed supply and air start unit is prohibited.

AIR START UNIT DISC ....REQUEST

L2 *Simultaneous use of air start unit and the engine bleed is prohibited to prevent any adverse effect on the bleed system.*

L1 PACK 1+2.. ON

L2 *When both packs are set to ON, engine IDLE power is higher and appropriate for a crossbleed engine start.*

L1 APU BLEED.. CHECK OFF

MANUAL ENGINE START

Ident.: PRO-NOR-SUP-SUP-ENG-00016287.0001001 / 01 OCT 15
Applicable to: ALL

ENGINE START

THR LEVERS....................IDLE | PF

CAUTION	*The engines start regardless of the thrust lever position. If the thrust levers are not set to IDLE, the thrust rapidly increases to the corresponding thrust lever position, causing a hazardous situation.*

ENG START SEL..NORM THEN IGN START

L2 *The ENG SD page appears, and all pack valves close.*

Note: The pack valves open again if the ENG MAN START pb-sw is not set to ON within 30 s.

L1 *Note: During a manual engine start, the FADEC has limited control and does not aborts an abnormal manual start, except in the case of rotor overspeed. Therefore, if the flight crew suspects an engine start malfunction, or if an engine-related ECAM alert is triggered, the PF must interrupt the manual start sequence and perform one of the following:*
- *Before the PF sets the ENG MASTER lever to ON, the PF must set the ENG MAN START pb-sw to OFF, or*
- *After the PF sets the ENG MASTER lever to ON, the PF must set the ENG MASTER lever to OFF.*

Then, the PF must announce "ECAM actions", in accordance with the ECAM management philosophy.
Before the flight crew performs another manual engine start, they should consider a dry cranking of the affected engine, if dry cranking is not part of the ECAM procedure (Refer to PRO-NOR-SUP-SUP-ENG Engine Ventilation (Dry Cranking)).
In the case of ENG 1(2) START FAULT [EGT OVERLIMIT] alert, second manual engine start attempt on the affected engine is not permitted.

● **When all engines parameters are available on the ENG SD page:**

ENG 1 MAN START...ON

L2 *Note: For any operational reason, engine 2 can be started first.*

L1 ENG PARAMETERS ....MONITOR

L2 *In manual engine start mode, the FADEC does not automatically abort an abnormal manual start, except in the case of rotor overspeed. However, in the case of any engine malfunction, the FADEC still generates ECAM alerts, as necessary. As a result, the flight crew must closely monitor the manual start sequence, and the PF must be ready to immediately set the master lever of the affected engine to OFF when necessary.*

L1 START VALVE..CHECK IN-LINE
START VALVE PRESSURE...CHECK GREEN
OIL PRESSURE INCREASE..CHECK
N3 INCREASE..CHECK

● **When the maximum motoring speed is reached and the EGT< 150 °C:**

- N2 (8 % minimum)
- N3 (25 % minimum)

L2 The maximum motoring speed is reached when there is no significant increase of N3 and N2.

In order to maximize stable compressor operation at light-off, the EGT should be < 150 °C.
If the manual engine start is aborted, hot air may stagnate in the combustor chamber leading to no light up event. The flight crew has to perform a dry crank if the EGT > 150 °C.

L1 ENG 1 MASTER..ON
CHRONO..START

L2 *The PM starts timing in order to monitor the light-up delay.*

L1 [ENG SD PAGE] IGNITORS A AND B INDICATIONS..CHECK
[ENG SD PAGE] FF INCREASE..CHECK

- **20 s maximum after the ENG 1 MASTER is set to ON:**

ENGINE START VALVE MANUAL OPERATION

Ident.: PRO-NOR-SUP-SUP-ENG-00021218.0001001 / 09 MAR 16
Applicable to: ALL

BEFORE ENGINE START

Advise ground crew to prepare for manual engine start valve operation.

ENGINE START

RMP INT..SELECT

The flight crew can establish communication with ground crew using service interphone at any service area next to the affected engine:
- *Select RMP CAB*
- *Or use the cockpit handset.*

GND CREW CLEARANCE..OBTAIN

- **When ground crew is ready:**

  ENG START SEL..IGN START
  ENG (AFFECTED) MASTER..ON
  ENG START VALVE..REQUEST OPEN

L2 *The ground crew must maintain the valve in the OPEN position until the engine is started. If not, the start valve closes.*

L1
  - **When N3 is at 48 % :**

    ENG START VALVE..REQUEST CLOSE
    SOP — ENGINE START..RESUME

ENGINE VENTILATION (DRY CRANKING)

Ident.: PRO-NOR-SUP-SUP-ENG-00023013.0001001 / 30 JUL 15
Applicable to: ALL

On ground, after a manual engine start attempt that is not successful, the flight crew can perform a dry crank cycle on the affected engine to remove the fuel vapors and to reduce residual EGT to 150 °C.

BEFORE MANUAL DRY CRANK CYCLE

ENG MASTER..CHECK OFF
ENG START SEL..CHECK NORM
ENG MAN START P/B..CHECK OFF

MANUAL DRY CRANK CYCLE

ENG START SEL..CRANK
ENG MAN START P/B..ON

- **When the EGT ≤ 150 °C:**

  ENG MAN START P/B..OFF
  ENG START SEL..NORM

  Note: For manual engine start Refer to PRO-NOR-SUP-SUP-ENG Manual Engine Start.

ONE ENGINE TAXI

Applicable to: ALL

Ident.: PRO-NOR-SUP-SUP-ENG-E-00021974.0001001 / 30 JAN 17

GENERAL

The flight crew should be aware of the following:
- One-engine taxi may require more thrust than normal. Therefore, the flight crew must be careful in order to avoid excessive jet blast and the risk of Foreign Object Damage (FOD).
- Some operational conditions may prevent, or make more difficult one-engine taxi. The following are examples of some of these conditions:
  - Positive slope (i.e. uphill)
  - Slippery taxiway
  - High aircraft gross weight (slow or short-radius turns in the direction of the operating engine may not be possible at high gross weight).

Ident.: PRO-NOR-SUP-SUP-ENG-E-00021111.0001001 / 27 SEP 18

AT DEPARTURE

ENGINE 1..START | PF

L2 *For any operational reason, engine 2 can be started instead of engine 1.*

L1 XBLEED selector..OPEN | PF

L2 *Open the crossbleed valve in order to supply both packs.*

L1 AFTER START SOP..PERFORM | PF-PM

L2 *For a detailed description of the After Start SOP, Refer to After Start.*

L1 AFTER START C/L..DELAY | PF-PM

Delay the After Start checklist until all engines are started.

TAXI SOP..PERFORM | PF-PM

Apply the Taxi SOP, but:
- *Delay the flight controls check until all engines are started*
- *Arm the Autobrake after the flight controls check.*

L2 *For a detailed description of the Taxi SOP, Refer to Taxi.*

L1 ● **At least 5 min before takeoff (2 min if the engines were shut down for less than 1.5 h during transit):**

ENGINE 2..CROSSBLEED START | PF

L2 *For more information, Refer to Crossbleed Engine Start Supplementary Procedure.*

5 AT ARRIVAL

APU.....AS RQRD | PM

- **No less than 5 min after high thrust operations, and when taxiing straight:**
  - **If the flight crew starts the APU before engine shutdown:**
    APU START PB.....CHECK AVAIL | PF

  ENGINE 1 OR 2.....SHUT DOWN | PF
  - **If engine 2 is shut down while the APU is off:**

    Refer to DSC-46-OIS-35 OIS Applications Temporary Loss After ENG 2 Shutdown

EXPECT REVERSION TO DIRECT LAW

L2 A duration longer than approximately 5 min of taxi with one engine after landing will trigger F/CTL DIRECT LAW (PROT LOST) (*Refer to procedure*), followed by ENG GA SOFT FAULT and NAV RNP AR CAPABILITY LOST. This reversion to direct law has no effect on aircraft dispatch.

L1
- **If the APU is off:**
  - **Before the second engine shutdown:**
    EXT 1(2) PB.....CHECK AVAIL | PF
    EXT 1(2) PB.....AUTO | PF

SAFETY PRECAUTIONS FOR GROUND FUEL OPERATIONS

Ident.: PRO-NOR-SUP-SUP-FUEL-00021161.0001001 / 17 NOV 17
Applicable to: ALL

WARNING	1. Prior initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft. 2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed. 3. If the APU fails during any ground fuel operations, do not restart the APU.

SAFETY PRECAUTIONS..........APPLY

During any ground fuel operations, ensure that:

- *The aircraft is properly bonded to the tanker*
- *The tanker and the aircraft grounding requirement is based on local regulations. Always connect the ground cable to the parking ground point (or to the tanker) before connecting it to the aircraft*
- *The external lighting is not operated except for*
  - *Navigation lights (NAV sw),*
  - *Logo lights (LOGO sw),*
  - *Wing and engine scan lights (WING sw).*

ACCESS PLATFORM..........IN POSITION

CAUTION	Do not use the right wing refuel coupling and the left wing refuel coupling ◁ at the same time.

FUEL TANKER HOSES CONNECTION..........CHECK

One or two fuel hoses can be used to perform a refuel operation.

MAX REFUELING PRESSURE: 55 PSI (3.8 BAR)

AUTOMATIC REFUELING

Ident.: PRO-NOR-SUP-SUP-FUEL-00021924.0002001 / 03 JUL 20
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD

1 [SUP] SAFETY PRECAUTIONS.......... *REFER TO PROC APPLY*

■ **If the aircraft is electrically powered with an EXT PWR or the APU:**

■ **If the refueling is performed from the cockpit via the REFUEL pb-sw ◁ :**

FMS FUEL & LOAD PAGE..........SELECT
BLOCK..........ENTER

L2 *Enter the desired FOB value in the BLOCK entry field and validate.*
The new value must be different from the existing one, if any.

[OVERHEAD PANEL] REFUEL pb-sw .... ON

Start the automatic refuel from the cockpit.
The flight crew should press the REFUEL pb-sw shortly after they enter the BLOCK value in order to avoid that maintenance crew opens the ERP and reset the preselected BLOCK value.

REFUEL IN PROGRESS

The refueling automatically starts as soon as the tests are completed. The REFUEL IN PROGRESS memo appears on the WD.

FUEL SD page .... DISPLAY
FUEL QUANTITY .... MONITOR

On the FUEL SD page, check that the fuel quantity increases.

- **When the END light of the REFUEL pb-sw comes on :**

  FUEL QUANTITY .... CHECK

  On the FUEL SD page, check that the fuel quantity is within 200 kg (440 lb) of the preselected BLOCK value.

  [OVERHEAD PANEL] REFUEL pb-sw .... OFF

  The automatic refueling stops.

■ **If the refueling is performed from the External Refuel Panel (ERP):**

PRESELECT (PFQ) .... SET

Select the total fuel quantity that is required onboard the aircraft at the end of the refueling, with the PRESELECT sw.

REFUEL/DEFUEL VALVES sw .... CHECK SHUT
MODE SELECT .... AUTO REFUEL

Fuel system tests are automatically started, the SHUTOFF TEST label is displayed as long as the test is in progress (approximately 30 s).

AUTO REFUEL

The refueling automatically starts as soon as the tests are completed. The AUTO REFUEL indication appears on the STATUS displays of the ERP, and the REFUEL IN PROGRESS memo appears on the WD in the cockpit.

FUEL QUANTITY .... MONITOR

On the ERP, check that the fuel quantities of the fuel tanks, and the ACTUAL (FOB) value increase.
For aircraft equipped with REFUEL pb-sw , the PFQ is the last entered value between the ERP and the BLOCK value. As a consequence, the PFQ changes if the flight crew updates the BLOCK value of the FMS FUEL & LOAD Page during refueling.

- **When the AUTO REFUEL END message appears on the ERP:**

  FUEL QUANTITY....................CHECK

  The fuel quantity on the ACTUAL (FOB) is within 200 kg (440 lb) of the PRESELECTED (PFQ) value.

  MODE SELECT....................OFF

  The ERP STATUS displays the OFF MODE indication.

■ **If the refueling is performed on batteries:**

MAX REFUEL TIME ON BATTERY: 10 MIN
[ELEC PANEL] BAT 1 pb-sw ....ON
[ELEC PANEL] BAT 2 pb-sw ....ON

- **After 10 s:**

  [ERP] POWER SUPPLY sw ....BATTERY

PRESELECT (PFQ)....................SET

Select the total fuel quantity that is required onboard the aircraft at the end of the refueling, with the PRESELECT sw.

[ERP] REFUEL/DEFUEL VALVES sw ....CHECK SHUT
[ERP] MODE SELECT....................AUTO REFUEL

Fuel system tests are automatically started, the SHUTOFF TEST label is displayed as long as the test is in progress (approximately 20 s).

AUTO REFUEL

The refueling automatically starts as soon as the tests are completed. The AUTO REFUEL indication appears on the STATUS displays of the ERP.

[ERP] FUEL QUANTITY....................MONITOR

On the ERP, check that the fuel quantities of the fuel tanks and the ACTUAL (FOB) value increase.

- **When the AUTO REFUEL END message appears on the ERP:**

  [ERP] FUEL QUANTITY....................CHECK

  The fuel quantity on the ACTUAL (FOB) is within 200 kg (440 lb) of the PRESELECTED (PFQ) value.

FLIGHT WITH GEAR DOWN

Applicable to: ALL

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00022736.0001001 / 09 MAR 16

This chapter applies to dispatch with L/G down. A revenue flight is permitted with the L/G down, and the L/G gear doors closed in the conditions stated below.

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00022734.0004001 / 28 MAY 20

1 FLIGHT PREPARATION - LIMITATIONS

MAX FL : 350
MIN TAT : -38 °C

L2 *This minimum TAT is required to maintain the minimum fluid temperature in the L/G shock absorbers.*

L1 MIN SAT BELOW 21 000 FT : -45 °C
MIN SAT AT OR ABOVE 21 000 FT : -52 °C

L2 *Due to the lower cruise speed, the TAT is more likely to come close to the minimum limit. The minimum values of SAT (depending on the altitude) ensure the capability to maintain this minimum TAT, either by accelerating or descending to a lower altitude.*

L1 MAX FLT TIME : 8 HR
MIN LDG WEIGHT : 150 000 KG (330 700 LBS)

L2 *The aircraft weight must remain more than this minimum weight during the entire flight (that includes diversion to the alternate airport) for handling quality reasons (protection against possible high speed excursion).*

L1 MAX SPEED : 255/.64

L2 *VMO/MMO for a flight with the L/G in the extended position and L/G doors closed is 255 kt/M 0.64.*

L1 RECOMMENDED SPEED : 245/.55

L2 245 kt/M 0.55 is the recommended speed for climb, cruise, and descent.

L1 FLT IN EXPECTED ICING CONDs : NOT PERMITTED

L2 *Due to the possible ice accretion on the L/G, flight is not permitted in expected icing conditions.*

L1 RVSM : NOT PERMITTED
ETOPS : NOT PERMITTED

DITCHING NOT DEMONSTRATED

DISPATCH NOT PERMITTED WITH MEL ITEMS AFFECTING RA, ADIRS, SLATS/FLAPS, F/CTL, BRAKE, TACHOMETER, LGERS COMPUTERS (L/G CTL 1 & 2, CPIOM H61, H62, H63 & H64), CRDC A02, A07, A10, A11, A12 & A13, ENG REVERSER, HYD ENG PMP, AND A/THR

ACCU REINFLATE NOT AVAIL IN FLT : BRAKING ON ACCU DEGRADED

L2 Due to the fact that the L/G remains in the extended position, there is no automatic refill of the brake accumulators in flight. In addition, the hydraulic pressure in the brake accumulators is slightly reduced at landing. This pressure reduction is more significant if the L/G is exposed to outside air temperatures less than -20 °C (-4 °F).

L1 AUTO-DERATE CLB : DO NOT USE

L2 *Because the AUTO-DERATE function is not designed to be used with the L/G in the extended position, the flight crew must select CLB (maximum climb) thrust for climb.*

L1 GA THR : TOGA ONLY

L2 *Because the soft go-around function is not designed to be used with the L/G in the extended position, the flight crew must select TOGA thrust for go-around.*

L1 MANAGED VERTICAL MODES (CLB & DES) : DO NOT USE

L2 *Due to the L/G in the extended position in flight, the FMS vertical guidance is not accurate.*

L1 MANAGED SPEED (EXCEPT IN APPR) : DO NOT USE
FMS PRED (ALT, SPD, TIME & PSEUDO-WPT) : DO NOT USE

Note: *However, in level flight, time predictions at cruise waypoints are correct.*

FUEL CONSUMPT INCRSD

FMS FUEL PRED UNRELIABLE WITHOUT ACCURATE FMS FUEL PENALTY INSERTION

L2 For more information about FMS fuel penalty value and insertion procedure, *Refer to PRO-NOR-SUP-SUP-LG Flight With Gear Down - Cockpit Preparation*.

L1 SIGNS AUTO MODE : DO NOT USE

L2 *Because the L/G is in the extended position, the signs remain on during the whole flight if the AUTO mode is used.*

L1 REDUCED DME RANGE

L2 The range of the DME antenna is reduced by approximately 75 NM at high altitude (at or above FL 265).

L1 CRUISE SD PAGE NOT AVAIL

L2 Because the L/G is in the extended position, the default SD page is the WHEEL SD page. The flight crew should check the other SD pages more frequently.

L1
- **In the case of** HYD Y SYS PRESS LO **ECAM alert in flight:**

  MAX XWIND FOR LANDING : 20 KT

L2 *As nose wheel steering is lost, and differential braking performance is slightly degraded due to lower accumulator pressure, the lateral control at low speed is ensured for a crosswind up to 20 kt only.*

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00022740.0004001 / 05 JUN 18

DURING PRELIMINARY COCKPIT PREPARATION

L/G LEVER

L/G LEVER COVER.....IN PLACE

L2 *Check that the appropriate cover is in place on the L/G lever.*

L1 ECAM/LOGBOOK CHECK

FLT L/G DOWN MEMO.....CHECK DISPLAYED

L2 *The ground crew should set the VMO/MMO switch on the "L/G DOWN" position. The FLT L/G DOWN memo on the ECAM indicates this position.*

L1 [LOGBOOK] L/G LOCKING DEVICES INSTALLATION (IF RQRD) : CHECK LOGGED

L2 *Depending on the cause of the L/G retraction failure, the installation of L/G locking devices may be required or not. Check in the logbook whether maintenance crew has logged the installation of L/G locking devices instead of the safety pins.*

L1 MEL/CDL ITEMS CHECK

DISPATCH NOT PERMITTED WITH MEL ITEMS AFFECTING RA, ADIRS, SLATS/FLAPS, F/CTL, BRAKE, TACHOMETER, LGERS COMPUTERS (L/G CTL 1 & 2, CPIOM H61, H62, H63 & H64), CRDC A02, A07, A10, A11, A12 & A13, ENG REVERSER, HYD ENG PMP, AND A/THR

TAKEOFF PERF

RECOMMENDED FLAPS : CONF 1+F

L2 CONF 1+F configuration gives the lower drag.

L1 AVOID TAILWIND
T.O PERF WITH L/G DOWN.....COMPUTE

L2 *Takeoff performance is affected, compute takeoff performance with the L/G in the extended position.*

L1 Note: *In the Airbus EFB T.O PERF application, select the "Landing gears position All extended" MEL item.*

LANDING PERF (DISPATCH)

MIN LDG WEIGHT : 150 000 KG (330 700 LBS)

L2 *The aircraft weight must remain more than this minimum weight during the entire flight (that includes diversion to the alternate airport) for handling quality reasons (protection against possible high speed excursion).*

L1 LDG PERF WITH L/G DOWN.. CHECK

L2 *Landing performance (go-around gradient and RLD) is affected, check landing performance with the L/G in the extended position.*

L1 *Note:* *In the Airbus EFB LDG PERF application (DISPATCH computation mode), select the "Landing gears position All extended" MEL item.*

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00023003.0001001 / 09 MAR 16

DURING EXTERIOR WALKAROUND

L/G LOCKING DEVICES..AS APPROPRIATE

L2 *Depending on the cause of the L/G retraction failure, the installation of L/G locking devices may be required or not. Check that the L/G locking devices installation is in accordance with the logbook status.*

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00023004.0001001 / 12 DEC 16

DURING COCKPIT PREPARATION

OVERHEAD PANEL

SIGNS AUTO MODE : DO NOT USE

L2 *Because the L/G is in the extended position, the signs remain on during the whole flight if the AUTO mode is used.*

L1 **MFD FMS PREPARATION**

FMS FUEL PRED UNRELIABLE WITHOUT ACCURATE FMS FUEL PENALTY INSERTION

L2 The fuel consumption is increased. The FUEL PENALTY on the FMS DATA/STATUS page should be updated.

L1 *Note:* *A conservative value for the fuel penalty is provided in the Fuel Penalty INOP SYS TABLE for L/G - L/G RETRACTION - All L/G extended (Refer to PER-IFT-FP Fuel Penalty Tables - Fuel Consumption Increased).*

[FMS-DATA/STATUS PAGE] FUEL PENALTY...INSERT

RECOMMENDED SPEED : 245/.55

L2 245 kt/M 0.55 is the recommended speed for climb, cruise, and descent.

L1 [FMS-ACTIVE/PERF PAGES] PRESEL SPDs .... INSERT
[FMS-ACTIVE/PERF/CLB PAGE] THR — “CLB”..INSERT

L2 *The auto-derate thrust is not designed to be used with the L/G in the extended position. The flight crew must select maximum climb thrust (CLB) for climb.*

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00023005.0001001 / 09 MAR 16

TAKEOFF

WHEN POSITIVE CLIMB

L/G : KEEP DOWN

AT S SPEED

A/BRK RTO....................CHECK DISARMED

L2 *After standard actions, check that BRK RTO does not appear on the FMA.*

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00023006.0001001 / 28 MAY 20

2 DURING CLIMB AND CRUISE

AUTO-DERATE CLB : DO NOT USE

L2 *Because the AUTO-DERATE function is not designed to be used with the L/G in the extended position, the flight crew must select CLB (maximum climb) thrust for climb.*

L1 MAX FL : 350
MIN TAT : -38 °C

L2 *This minimum TAT is required to maintain the minimum fluid temperature in the L/G shock absorbers.*

L1 MIN SAT BELOW 21 000 FT : -45 °C
MIN SAT AT OR ABOVE 21 000 FT : -52 °C
TEMPERATURE (SAT & TAT)....................MONITOR

L2 *Due to the lower cruise speed, the TAT is more likely to come close to the minimum limit. The minimum values of SAT (depending on the altitude) ensure the capability to maintain this minimum TAT, either by accelerating or descending to a lower altitude.*

L1 RVSM : NOT PERMITTED
AVOID ICING CONDs

RECOMMENDED SPEED : 245/.55

L2 245 kt/M 0.55 is the recommended speed for climb and cruise.

L1

CRUISE SD PAGE NOT AVAIL

L2 Because the L/G is in the extended position, the default SD page is the WHEEL SD page. The flight crew should check the other SD pages more frequently.

L1

REDUCED DME RANGE

L2 The range of the DME antenna is reduced by approximately 75 NM at high altitude (at or above FL 265).

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00023007.0001001 / 05 JUN 18

ENGINE FAILURE

EO MAX ALT.. COMPUTE

L2 *The EO MAX ALT displayed by the FMS does not take into account the extended position of the L/G. The flight crew should use an alternate source to determine the EO maximum altitude.*

L1 *Note:* *In the Airbus EFB IN-FLT PERF application (DES (OEI) panel):*
- *Select the "L/G DISPATCH WITH GEAR DOWN" NON STD CONF item*
- *Select DES TYPE: OBSTACLE for a drift-down at Green Dot speed, or DES TYPE: EO STANDARD for a descent at fixed speed.*

GREEN DOT SPD : VLS + 12 KT

L2 The green dot speed displayed by the PFD does not take into account the extended position of the L/G.

Ident.: PRO-NOR-SUP-SUP-LG-SUP-LG-00023009.0002001 / 05 JUN 18

LANDING PERFORMANCE

LDG PERF WITH L/G DOWN.. CONFIRM

L2 *Go-around performance is affected.*

L1 *Note:* *In the Airbus EFB LDG PERF application (IN-FLIGHT computation mode), select the "Landing gears position All extended" MEL item.*

FOR DESCENT AND APPROACH

RECOMMENDED SPEED : 245/.55

L2 245 kt/M 0.55 is the recommended speed for descent.

L1 DESCENT SELECTED V/S MODE.. CONSIDER

L2 *To avoid a high rate of descent due to the L/G in the extended position, consider using selected vertical speed.*

L1 AVOID ICING CONDs

FOR HOLDING : CONF 1 RECOMMENDED

L2 Slats extended is the least penalizing configuration.

L1 ● **In the case of** HYD Y SYS PRESS LO **ECAM alert:**

MAX XWIND FOR LANDING : 20 KT

L2 *As nose wheel steering is lost, and differential braking performance is slightly degraded due to lower accumulator pressure, the lateral control at low speed is ensured for a crosswind up to 20 kt only.*

L1 GA THR : TOGA ONLY

L2 *Because the soft go-around function is not designed to be used with the L/G in the extended position, the flight crew must select TOGA thrust for go-around.*

ICING CONSIDERATION FOR ETOPS CRITICAL FUEL RESERVES

Ident.: PRO-SPO-ETOPS-00021720.0001001 / 09 MAR 16
Applicable to: ALL

The most critical scenario must be compensated for the greater of:

A. The effect of airframe icing during 10 % of the time during which icing is forecast, including ice accumulation on unprotected surfaces, and the fuel used by engine and wing anti-ice during this period.

B. Fuel for engine and wing anti-ice for the entire time during which icing is forecast.

Note: *The ETOPS icing fuel reserve is always limited by (B).*

Unless a reliable icing forecast is available, icing may be presumed to occur when the Total Air Temperature (TAT) is less than +10 °C (50 °F), or if the outside air temperature is between 0 °C (32 °F) and -20 °C (-4 °F) with a relative humidity of 55 % or more.

DIVERSION DECISION MAKING

Ident.: PRO-SPO-ETOPS-00021456.0001001 / 03 SEP 14
Applicable to: ALL

Diversion is required in the case of only one generator (either one VFG, or APU GEN) remaining available following a multiple failure.

ABNORMAL AND EMERGENCY PROCEDURES

GENERAL

Applicable to: ALL

Ident.: PRO-SPO-PBN-A-00021688.0001001 / 09 JAN 18

GENERAL

The Performance-Based Navigation (PBN) concept implies that the aircraft follows the defined track with a requested navigation performance. PBN includes several types of operations named RNAV and RNP that apply to all flight phases.
An operational approval from the Operators national authorities is sometimes required for some RNAV or RNP operations.
The AFM provides regulatory compliances associated with PBN operations.

Ident.: PRO-SPO-PBN-A-00021689.0001001 / 08 NOV 18

RNAV/RNP CAPABILITY

Before the aircraft enters a RNAV/RNP airspace, RNAV/RNP capability is based on:

- The required RNAV/RNP equipment that is described in each RNAV/RNP section of the FCOM
- Navigation Accuracy HIGH displayed on the FMS POSITION/MONITOR page for RNAV operations
- NAV PRIMARY displayed on the FMS POSITION/MONITOR page for RNP operations
- RNP AR capability indicated on the ECAM for RNP AR operations
- Any specific local requirements published in the Aeronautical Information Publication (AIP).

RNAV 10/RNP 10

Applicable to: ALL

Ident.: PRO-SPO-PBN-B-00021698.0001001 / 09 JAN 18

GENERAL

RNAV 10 operations correspond to RNP 10 operations.
In RNAV 10 airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.
Required equipment and procedures for RNAV 10, described in this section, cover the navigation requirements of the Minimum Navigation Performance Specification (MNPS) operations.

Ident.: PRO-SPO-PBN-B-00006863.0001001 / 09 JAN 18

REQUIRED RNAV 10 EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNAV 10 airspace:

- Two FMS
- Two IRS
- One GPS if the flight time outside radio navaid coverage is longer than either :
  - 6.2 h from the time of IRS ground alignment, or
  - 5.7 h from the time of the last radio position update.

Ident.: PRO-SPO-PBN-B-00021699.0001001 / 09 JAN 18

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- If one of the following messages appears:
  - NAV PRIMARY LOST on only one ND/MFD
  - NAV ACCURACY DOWNGRADED on only one ND/MFD,

  the flight crew can continue navigation with the side that provides the best position.
- If NAV PRIMARY LOST appears on both NDs/MFDs, RNAV 10 operations can be continued:
  - if radio navaids update is available, there is no time restriction
  - if radio navaids update is not available, then RNAV 10 operations can be continued for 5.7 h from the time of the last position.

  Note: *As per regulation, after 5.7 h, the navigation accuracy shall be considered as downgraded regardless of the current navigation accuracy that is displayed on the FMS POSITION/MONITOR page.*

- If the NAV GNSS/ACFT POS DISAGREE ECAM alert appears, the flight crew should check the position data using the FMS POSITION/MONITOR page. This action permits to identify the side that provides the best position. The flight crew can then continue navigation with the side that provides the best position.
- If NAV ACCURACY DOWNGRADED appears on both NDs/MFDs, all the following is applicable:
  - As per design, the FMS uses the default RNP value. This default value (2 NM in cruise, 1 NM in terminal area) is more restrictive than airspace required navigation performance.
  - The flight crew can modify, on the FMS, the RNP default value and manually select a specific navigation accuracy in accordance with airspace requirement. When the aircraft leaves the airspace, the flight crew should set back the default value.
    - If NAV ACCURACY DOWNGRADED remains displayed, the flight crew should inform the ATC that RNAV 10 capability is lost.

RNAV 5/B-RNAV

Applicable to: ALL

Ident.: PRO-SPO-PBN-C-00021700.0001001 / 09 JAN 18

GENERAL

RNAV 5 operations correspond to European B-RNAV operations.

Ident.: PRO-SPO-PBN-C-00021701.0001001 / 08 NOV 18

REQUIRED RNAV 5 EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNAV 5 airspace:
- One FMS
- One GPS, or one VOR/DME, or two DME for aircraft position update
- One IRS.

Ident.: PRO-SPO-PBN-C-00006868.0001001 / 09 JAN 18

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- If one of the following messages appears:
  - NAV PRIMARY LOST on only one ND/MFD
  - NAV ACCURACY DOWNGRADED on only one ND/MFD,

  the flight crew can continue navigation with the side that provides the best position.
- If one of the following messages appears:
  - NAV PRIMARY LOST on both NDs/MFDs
  - NAV GNSS/ACFT POS DISAGREE on the ECAM,

  the flight crew should check the position data with navaid raw data using the FMS POSITION/MONITOR page. This action permits to identify the side that provides the best position. The flight crew can then continue navigation with the side that provides the best position.
- If NAV ACCURACY DOWNGRADED appears on both NDs/MFDs, all the following is applicable:
  - As per design, the FMS uses the default RNP value. This default value (2 NM in cruise, 1 NM in terminal area) is more restrictive than airspace required navigation performance.
  - The flight crew can modify, on the FMS, the RNP default value and manually select a specific navigation accuracy in accordance with airspace requirement. When the aircraft leaves the airspace, the flight crew should set back the default value.
    - If NAV ACCURACY DOWNGRADED remains displayed, the flight crew should inform the ATC that RNAV 5 capability is lost.

RNAV 2/EN-ROUTE RNAV

Applicable to: ALL

Ident.: PRO-SPO-PBN-K-00024578.0001001 / 09 JAN 18

GENERAL

RNAV 2 operations correspond to En-Route RNAV operations.
The AIP may specify that GPS equipment is required.

Ident.: PRO-SPO-PBN-K-00024579.0001001 / 09 JAN 18

REQUIRED RNAV 2 / EN-ROUTE RNAV EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNAV 2 airspace:

- One FMS
- One GPS, or one VOR/DME, or two DME for aircraft navigation update
- Two IRS
- One FD in NAV mode.

Ident.: PRO-SPO-PBN-K-00024580.0001001 / 09 JAN 18

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- If one of the following messages appears:
  - NAV PRIMARY LOST on only one ND/MFD
  - NAV ACCURACY DOWNGRADED on only one ND/MFD,

  the flight crew can continue navigation with the side that provides the best position.
- If one of the following messages appears:
  - NAV PRIMARY LOST on both NDs/MFDs
  - NAV GNSS/ACFT POS DISAGREE on the ECAM,

  the flight crew should check the position data with navaid raw data using the FMS POSITION/MONITOR page. This action permits to identify the side that provides the best position. The flight crew can then continue navigation with the side that provides the best position.
- If NAV ACCURACY DOWNGRADED appears on both NDs/MFDs, the flight crew should inform the ATC that RNAV 2 capability is lost.

RNAV 1/P-RNAV TERMINAL RNAV

Applicable to: ALL

Ident.: PRO-SPO-PBN-D-00021702.0001001 / 09 JAN 18

GENERAL

RNAV 1 operations correspond to P-RNAV - Terminal RNAV operations.
The AIP may specify that GPS equipment is required.

Ident.: PRO-SPO-PBN-D-00006864.0001001 / 09 JAN 18

REQUIRED RNAV 1 EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNAV 1 airspace:
- One FMS
- One GPS, or one VOR/DME, or two DME for aircraft navigation update
- Two IRS
- One FD in NAV mode.

Ident.: PRO-SPO-PBN-D-00021703.0001001 / 09 JAN 18

PROCEDURE

BEFORE THE AIRCRAFT ENTERS RNAV 1 AIRSPACE

The flight crew must crosscheck the terminal procedure from the published charts with the FMS navigation database on the F-PLN page.

IN RNAV 1 AIRSPACE

The flight crew can only modify this terminal procedure if required by the ATC (e.g. DIR TO, radar vectoring, and insertion of waypoints from the navigation database)..

MANAGEMENT OF DEGRADED NAVIGATION

- If one of the following messages appears:
  - NAV PRIMARY LOST on only one ND/MFD
  - NAV ACCURACY DOWNGRADED on only one ND/MFD,

  the flight crew can continue navigation with the side that provides the best position.
- If one of the following messages appears
  - NAV PRIMARY LOST on both NDs/MFDs
  - NAV GNSS/ACFT POS DISAGREE on the ECAM.

  the flight crew should check the position data with navaid raw data using the FMS POSITION/MONITOR page. This action permits to identify the side that provides the best position. The flight crew can then continue navigation with the side that provides the best position.
- If NAV ACCURACY DOWNGRADED appears on both NDs/MFDs, the flight crew should inform the ATC that RNAV 1 capability is lost.

RNP 4

Applicable to: ALL

Ident.: PRO-SPO-PBN-E-00021706.0001001 / 03 SEP 14

GENERAL

In this airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-PBN-E-00006869.0001001 / 09 JAN 18

REQUIRED RNP 4 EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNP 4 airspace:
- Two FMS
- One GPS
- Two IRS.

Ident.: PRO-SPO-PBN-E-00021707.0001001 / 09 JAN 18

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- If one of the following messages appears:
  - NAV PRIMARY LOST on only one ND/MFD
  - NAV ACCURACY DOWNGRADED on only one ND/MFD,

  the flight crew can continue navigation with the side that provides the best position.
- If NAV GNSS/ACFT POS DISAGREE ECAM alert appears, the flight crew should check the position data using the FMS POSITION/MONITOR page. This action permits to identify the side that provides the best position. The flight crew can then continue navigation with the side that provides the best position.
- If NAV ACCURACY DOWNGRADED appears on both NDs/MFDs, all the following is applicable:
  - As per design, the FMS uses the default RNP value. This default value (2 NM in cruise, 1 NM in terminal area) is more restrictive than airspace required navigation performance.
  - The flight crew can modify, on the FMS, the RNP default value and manually select a specific navigation accuracy in accordance with airspace requirement. When the aircraft leaves the airspace, the flight crew should set back the default value.
    - If NAV ACCURACY DOWNGRADED remains displayed, the flight crew should inform the ATC that RNP 4 capability is lost.

RNP 2 IN OCEANIC AND REMOTE CONTINENTAL AREA

Applicable to: ALL

Ident.: PRO-SPO-PBN-I-00024575.0001001 / 09 JAN 18

In this airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-PBN-I-00024576.0001001 / 09 JAN 18

REQUIRED RNP 2 IN OCEANIC AND REMOTE CONTINENTAL AREA EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNP 2 oceanic and remote continental airspace:

- Two FMS
- One GPS
- Two IRS.

Ident.: PRO-SPO-PBN-I-00024577.0001001 / 09 JAN 18

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- If one of the following messages appears:
  - NAV PRIMARY LOST on only one ND/MFD
  - NAV ACCURACY DOWNGRADED on only one ND/MFD,

  the flight crew can continue navigation with the side that provides the best position.
- If NAV GNSS/ACFT POS DISAGREE ECAM alert appears, the flight crew should check the position data with navaid raw data using the FMS POSITION/MONITOR page. This action permits to identify the side that provides the best position. The flight crew can then continue navigation with the side that provides the best position.
- If NAV ACCURACY DOWNGRADED appears on both NDs/MFDs, the flight crew should inform the ATC that RNP 2 capability is lost.

RNP 2 IN DOMESTIC AREA

Applicable to: ALL

Ident.: PRO-SPO-PBN-J-00024573.0001001 / 09 JAN 18

REQUIRED RNP 2 IN DOMESTIC AREA EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNP 2 domestic airspace:
- One FMS
- One GPS
- Two IRS.

Ident.: PRO-SPO-PBN-J-00024574.0001001 / 09 JAN 18

PROCEDURE

- If one of the following messages appears:
  - NAV PRIMARY LOST on only one ND/MFD
  - NAV ACCURACY DOWNGRADED on only one ND/MFD,

  the flight crew can continue navigation with the side that provides the best position.
- If one of the following messages appears:
  - NAV PRIMARY LOST on both NDs/MFDs
  - NAV GNSS/ACFT POS DISAGREE on the ECAM,

  the flight crew should check the position data with navaid raw data using the FMS POSITION/MONITOR page. This action permits to identify the side that provides the best position. The flight crew can then continue navigation with the side that provides the best position.
- If NAV ACCURACY DOWNGRADED appears on both NDs/MFDs, the flight crew should inform the ATC that RNP 2 capability is lost.

RNP 1/TERMINAL RNP 1 BASIC RNP 1

Applicable to: ALL

Ident.: PRO-SPO-PBN-F-00021708.0001001 / 09 JAN 18

GENERAL

RNP 1 operations correspond to Terminal RNP 1 and Basic RNP 1.

Ident.: PRO-SPO-PBN-F-00021338.0001001 / 09 JAN 18

REQUIRED RNP 1 EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNP 1 airspace:
- One FMS
- One GPS
- Two IRS
- One FD in NAV mode.

Ident.: PRO-SPO-PBN-F-00021709.0001001 / 09 JAN 18

PROCEDURE

BEFORE THE AIRCRAFT ENTERS RNP 1 AIRSPACE

The flight crew must crosscheck the terminal procedure from the published charts with the FMS navigation database on the F-PLN page.

IN RNP 1 AIRSPACE

The flight crew can only modify the procedure if required by the ATC (e.g. DIR TO, radar vectoring, and insertion of waypoints from the navigation database).

MANAGEMENT OF DEGRADED NAVIGATION

- If one of the following messages appears:
  - NAV PRIMARY LOST on only one ND/MFD
  - NAV ACCURACY DOWNGRADED on only one ND/MFD,

  the flight crew can continue navigation with the side that provides the best position.
- If NAV GNSS/ACFT POS DISAGREE ECAM alert appears, the flight crew should check the position data with navaid raw data using the FMS POSITION/MONITOR page. This action permits to identify the side that provides the best position. The flight crew can then continue navigation with the side that provides the best position.
- If NAV ACCURACY DOWNGRADED appears on both NDs/MFDs, the flight crew should inform the ATC that RNP 1 capability is lost.

RNP APCH/RNAV(GNSS)

Applicable to: ALL

Ident.: PRO-SPO-PBN-G-00021710.0001001 / 09 JAN 18

GENERAL

RNP APCH operations correspond to approaches named RNAV(GNSS), or RNAV(GPS), or RNP.

These approaches are also identified by LNAV, LNAV/VNAV, or LPV.

Ident.: PRO-SPO-PBN-G-00006865.0001001 / 03 JUL 20

1 REQUIRED RNP APCH EQUIPMENT

The following is a list of the minimum navigation equipment that is required to enter RNP APCH airspace:
- One FMS
- One GPS
- Two IRS
- One FD in NAV mode.

Ident.: PRO-SPO-PBN-G-00021711.0001001 / 03 SEP 14

PROCEDURE

Refer to PRO-NOR-SOP-180-C Approach Using XLS - General.

RNP AR / RNAV(RNP)

Applicable to: ALL

Ident.: PRO-SPO-PBN-H-00021712.0001001 / 04 SEP 14

GENERAL

RNP AR operations correspond to RNAV(RNP) operations.
For RNP AR operations, the flight crew should refer to the specific procedures published by the airline.
The airline must obtain an operational approval and the flight crew must be qualified for this type of operations. To obtain this operational approval, the airline should refer to the AFM.
The main procedure steps for RNP AR have been introduced in the Procedures of this FCOM and in the paragraph below. This does not relieve the airline from the need to provide the flight crew with tailored procedures when required.

Ident.: PRO-SPO-PBN-H-00021349.0001001 / 08 NOV 18

REQUIRED RNP AR EQUIPMENT

The following table presents the equipment, not monitored by the PRIMs, required to perform RNP AR operations:

Required Equipment Not Monitored by the PRIMs	RNP AR down to RNP 0.1 NM	RNP AR limited to RNP 0.3 NM
MFDs	1	1
TAWS	1	1
KCCU	1 (1)	1 (1)

(1) *It is sufficient that KCCU has either an operative Cursor Control Device (CCD), or an operative keyboard.*

In addition, the following table presents equipment, as monitored by the PRIMs, to compute RNP AR capability:

Required Equipment Monitored by the PRIMs	RNP AR down to RNP 0.1 NM	RNP AR limited to RNP 0.3 NM
FMC	3	2
PRIM with AP ((1)), FD and A/THR available	2	1
EFIS	2	1
ADIRS	3	2
MMR	2	1
FWC	1	1
FCDC	1	1
CP	1 EFIS/AFS CP and 1 MFD FCU backup	1 EFIS/AFS CP or 2 MFD FCU backup

(1) *For RNP AR operations strictly below RNP 0.3 NM, 1 AP must be engaged in NAV mode.*

L2 *Note: The PRIMs also monitor navigation performance.*

If the PRIMs detect a RNP AR capability lost or downgraded, the ECAM and/or the ND display dedicated indications. For more information, *Refer to DSC-22-FMS-10-30-50 RNP AR Capability*.

Ident.: PRO-SPO-PBN-H-00021713.0001001 / 03 JUL 20

2 PROCEDURE

Prior starting a RNP AR instrument procedure, check that:
- A complete alignment of the IRS has been performed before takeoff
- OAT and wind, as applicable, are within limits
- The FMS lateral and vertical F-PLN extracted from the navigation database is in agreement with the instrument procedure chart, particularly check that the correct RNP values displayed on F-PLN page
- The RNP AR capability is in accordance with the intended RNP AR procedure.

Airbus recommends the use of a Ground Based Prediction Program in order to check NAV PRIMARY availability at the estimated time of operation in either of the following cases:
- For RNP AR operations strictly below 0.15 NM and with less than 24 satellites available
- Within constrained environment areas. An environment area is considered constrained in the case of GPS masking in mountainous area (GPS mask angle > 5 °).

L2 Out of the two previous cases, NAV PRIMARY is available 100 % of the time worldwide.

L1 If obstacles, TERR must be selected on both NDs unless weather monitoring is required on one side.

Airspeed and configuration must be adapted for the radius of turns in the procedure.

DEPARTURE

Before takeoff, check that:
- LDEV appears on PFDs,

L2 *Note: When the aircraft is aligned on the runway, the LDEV indication is centered.*

L1
- XTK with two precision digits appears on NDs.

L2 *Note: When the aircraft is aligned on the runway, the XTK value is equal to zero. As a result, the XTK does not appear on the NDs.*

L1 When NAV is indicated armed on FMA and, 5 s after liftoff, select AP ON.
Monitor lateral deviation on PFD or XTK on ND.
Callout "LAT DEV" must be performed when XTK or LDEV is at or above 1/2 dot.
If XTK or LDEV increases toward the current RNP value, take over manually to fly back on the intended flight path and reengage AP as applicable.

L2 XTK pulses if its value is above the current RNP value.

L1 APPROACH

Refer to PRO-NOR-SOP-180-C Approach Using APP-DES Guidance for RNP AR - General.

GO-AROUND

Refer to PRO-NOR-SOP-220 Go-Around - Go-Around Initiation.

Intentionally left blank

RVSM REQUIREMENTS

Applicable to: ALL

Ident.: PRO-SPO-RVSM-GRVSMR-00021171.0001001 / 02 OCT 14

A350 aircraft systems are designed to comply with the design criteria of the JAA Temporary Guidance Leaflet No. 6 (JAA TGL 6 - EASA Regulations), and the FAA Guidance Material for RVSM operations No. 91 - RVSM.
The AFM provides the statement of RVSM capability.

Ident.: PRO-SPO-RVSM-GRVSMR-00021173.0001001 / 02 OCT 14

In addition to the RVSM capability statement provided in the AFM, Operators must obtain operational approval from their national airworthiness authorities, in order to operate within the RVSM airspace.
The above-mentioned EASA and FAA documents also indicate the requirements for obtaining operational approval.

Ident.: PRO-SPO-RVSM-GRVSMR-00021174.0001001 / 02 OCT 14

The RVSM regulation requires that the following equipment or functions be operative:

- Two ADRs (for altitude indication)
- One transponder
  For associated MEL dispatch conditions, *Refer to MMEL/MI-34-71 Transponder*.
- One autopilot function

  For associated MEL dispatch conditions:
  - *Refer to MMEL/MI-22-10 AP*
  - *Refer to MMEL/MI-22-10 Sidesticks and Rudder Pedal Locking Devices in AP Mode*.

- Two PFDs (for altitude indication)
- One AFS CP channel or AFS CP backup (for the altitude target selection and the OP CLB or OP DES mode engagement)
- One FWS (for the altitude alert function).

Ident.: PRO-SPO-RVSM-GRVSMR-00021175.0001001 / 02 OCT 14

MAXIMUM DIFFERENCES BETWEEN ALTITUDE INDICATIONS

		Comparison of Altitude Indications (ft)	
Flight Level	Speed or Mach Number	Difference between ADRs (on the PFDs)	Difference between ISIS and ADRs (on the PFDs)
FL 50	250 kt	50	100
FL 100	250 kt	50	100
FL 200	320 kt	100	250
FL 290	M 0.85	150	400

Continued on the following page

Continued from the previous page

		Comparison of Altitude Indications (ft)	
FL 350	M 0.85	150	400
FL 430	M 0.85	150	400

RVSM PROCEDURE

Applicable to: ALL

Ident.: PRO-SPO-RVSM-GRVSMP-00021172.0001001 / 02 OCT 14

For flights in RVSM airspace, the flight crew must apply the standard or abnormal and emergency procedures, in addition to the following RVSM procedures:

Ident.: PRO-SPO-RVSM-GRVSMP-00021176.0001001 / 03 JAN 20

FLIGHT PREPARATION

The flight crew must take into account the conditions that may affect operations in RVSM airspace, including:

RVSM APPROVAL..CHECK

L2 *Verify that the aircraft is approved for RVSM operations.*

L1 WEATHER..CHECK

L2 *Review the weather forecasted for the flight route. If severe turbulence is expected, this may affect the ability to maintain aircraft altitude.*

L1 REQUIRED EQUIPMENT FOR RVSM..CHECK

L2 *Check that all the required equipment is operative (MEL).*
The flight crew should review the maintenance logs and forms, in order to ensure that the equipment required for RVSM is satisfactory.

L1 ALTITUDES..CHECK

L2 *Check that the difference between each altitude indication (in the QNH reference) displayed on PFDs and the airport elevation is less than 75 ft.*
Check on PFDs that the indication ADR 1(2)(3) ALT, ISIS ALT, BKUP ALT or GPS ALT is not displayed. For more information, Refer to DSC-31-CDS-40-20-50 Altitude.

Ident.: PRO-SPO-RVSM-GRVSMP-00021177.0001001 / 03 JAN 20

IN FLIGHT

BEFORE ENTERING RVSM AIRSPACE

REQUIRED EQUIPMENT FOR RVSM..OPERATIVE

L2 *If any of the required equipment fails before the aircraft enters RVSM airspace, the flight crew must request new clearance, to avoid this airspace.*

L1 ALTITUDES.. CHECK

L2 *Check that the difference between the altitude indications on PFDs (in the standard baro setting) is less than the specified tolerance. For more information, Refer to PRO-SPO-RVSM Maximum Differences between Altitude Indications.*
Check on PFDs that the indication ADR 1(2)(3) ALT, ISIS ALT, BKUP ALT or GPS ALT is not displayed. For more information,Refer to DSC-31-CDS-40-20-50 Altitude.

L1 **IN RVSM AIRSPACE**

AP.. KEEP ENGAGED

L2 *Ensure that autopilot is engaged for cruise, and for flight level changes.*

L1 AP GUIDANCE.. MONITOR

L2 *During flight level transitions, do not exceed or go below the assigned flight level by more than 150 ft.*

L1 - **Approximately every hour:**

  ALTITUDES..CHECK

L2 *Check that the difference between the altitude indications on PFDs is less than the specified tolerance. For more information, Refer to PRO-SPO-RVSM Maximum Differences between Altitude Indications.*
Regular checks of the flight deck instruments should be sufficient.
Check on PFDs that the indication ADR 1(2)(3) ALT, ISIS ALT, BKUP ALT or GPS ALT is not displayed. For more information, Refer to DSC-31-CDS-40-20-50 Altitude.

Ident.: PRO-SPO-RVSM-GRVSMP-00021178.0001001 / 02 OCT 14

AT THE END OF THE FLIGHT

ANY MALFUNCTIONS or DEVIATIONS... REPORT

L2 *Report any malfunction of the systems that enable the aircraft to maintain altitude, including:*
- *Any malfunction or loss of required equipment*
- *Any deviation involving the functions that enable the aircraft to maintain altitude.*

ABNORMAL AND EMERGENCY PROCEDURES

ATC.. NOTIFY

When the aircraft is in RVSM airspace, the flight crew must notify the ATC of the following situations, because they may affect the aircraft's ability to maintain the flight level:

- *The failure of both autopilots*
- *The loss of altimeter system redundancy:*
  - *The same ADR altitude is displayed on both PFDs. This is indicated with ADR 1(2)(3) ALT indication on PFDs.*
  - *The ISIS altitude is displayed on both PFDs. This is indicated with ISIS ALT indication on PFDs.*
  - *The backup altitude is displayed on both PFDs. This is indicated with BKUP ALT indication on PFDs.*
  - *The backup GPS altitude is displayed on both PFDs. This is indicated with GPS ALT indication on PFDs.*
- *An excessive discrepancy in altitude indications, and no way to identify the valid indication*
- *The failure of any other equipment, that affects the aircraft's ability to maintain the flight level*
- *The encounter of greater than moderate turbulence.*

If the flight crew cannot notify the ATC, or obtain ATC clearance, before deviating from the assigned flight level, they should follow the established contingency procedure and obtain ATC clearance as soon as possible.

L2 *Note: Appendix 4 of the JAA TGL 6 (EASA Regulations), and Appendix 5 of the FAA 91-RVSM (FAA Regulations), provide detailed Operator guidelines, on the content and development of contingency procedures.*

OVERVIEW

Ident.: PRO-SPO-PRM-00022173.0001001 / 03 JAN 20
Applicable to: ALL

Simultaneous Parallel Approach operations permit ILS/RNAV(GNSS)/RNAV(RNP)/GLS instrument approaches to be performed to dual or triple parallel runway configurations.

Two types of simultaneous approaches to parallel or near-parallel instrument runways exist:
- Independent Approaches, where radar separation minima between aircraft on adjacent extended runway center lines are not prescribed and approaches are monitored to ensure aircraft do not enter a No Transgression Zone (NTZ). A Precision Runway Monitor (PRM) system which enables simultaneous close parallel approaches may also be employed. The air traffic controllers use the PRM system to monitor the aircraft position.
- Dependent Approaches, where radar separation minima between aircraft on adjacent extended runway center lines are prescribed and aircraft are staggered to provide separation from the adjacent final course.

To perform Simultaneous Parallel Approach operations:
- The ATC and flight crew must satisfy specific training requirements.
- The ATC and the aircraft equipment must also comply with specific requirements.

BREAK OUT TURN AND CLIMB PROCEDURE

Ident.: PRO-SPO-PRM-00022174.0001001 / 30 JAN 17
Applicable to: ALL

Simultaneously:

AP..OFF | PF
BREAK OUT LEFT(RIGHT), HDG___, ALT___..........ANNOUNCE | PF
THR LEVERS..........................TOGA, and back to CL | PF

L2 *The SRS GA and the GA TRK modes engage. The THR CLB mode engages.*
The speed is managed. The speed target is the aircraft speed at SRS GA engagement.
The FMS GO-AROUND phase becomes active. Thus, the FMS reinserts the approach.

L1 TURN LEFT(RIGHT) AND CLIMB

L2 *As the situation is urgent, the flight crew should temporarily disregard the FD orders.*

L1 HDG___..............................TURN AND PULL | PM

L2 *The GA TRK mode disengages, and the HDG mode engages.*

L1 ALT___..............................TURN AND PULL | PM

L2 *The SRS GA mode disengages, and the OP CLB mode engages. The speed target becomes the FMS speed target of the CLIMB phase.*

L1 SPEED..............................PULL AND ADJUST | PM

L2 *For the initial break out procedure, adjust the speed (e.g.160 kt), in order to avoid a significant acceleration, and an increase in workload.*

L1 ● **When established on the break out path:**
AP..ON | PM

L2 *Before engaging the AP, ensure that the FD bar orders approximately correspond to the aircraft current path.*

L1 SPEED..............................SELECT AS RQRD | PF
FLAPS..AS RQRD | PM
GEAR..AS RQRD | PM
TCAS MODE SEL..........................TA/RA AS RQRD | PM

BREAK OUT TURN AND DESCENT PROCEDURE

Ident.: PRO-SPO-PRM-00022176.0001001 / 06 NOV 14
Applicable to: ALL

Simultaneously:

AP..OFF | PF
TURN LEFT(RIGHT) AND MAINTAIN RATE OF DESCENT
BREAK OUT LEFT(RIGHT), HDG___, ALT___..................ANNOUNCE | PF

L2 *As the situation is urgent, the flight crew should temporarily disregard the FD orders.*

L1 HDG___..................................TURN AND PULL | PM

L2 *The HDG mode engages. The vertical mode reverts to the V/S mode. The vertical speed target is the aircraft vertical speed at V/S engagement.*

L1 ALT___..................................TURN AND PULL | PM

L2 *This action defines an altitude target. The OP DES mode and the THR IDLE mode engage. The speed target does not change.*

L1 V/S..MONITOR | PM

CAUTION	*Depending on the speed target, the vertical speed may become excessive. If the rate of descent exceeds 1 000 ft/min, engage the V/S mode and limit the rate of descent to 1 000 ft/min.*

- **When established on the break out path:**

  AP..ON | PM

L2 *Before engaging the AP, ensure that the FD bar orders approximately correspond to the aircraft current path.*

L1
- **When cleared by ATC:**

  ALT___....................................TURN | PF

L2 *Select an altitude target for go-around, in accordance with the ATC clearance.*

L1 THR LEVERS........................TOGA, and back to CL | PF

L2 *The SRS GA and the GA TRK modes engage. The THR CLB mode engages.*
The speed is managed. The speed target is the aircraft speed at SRS GA engagement.
The FMS GO-AROUND phase becomes active.

L1 HDG___....................................PULL | PF

L2 *The GA TRK mode disengages, and the HDG mode engages. The SRS GA mode remains engaged, until ALT* engagement.*

L1 SPEED..............................SELECT AS RQRD | PF
FLAPS..AS RQRD | PM
GEAR...AS RQRD | PM

TCAS MODE SEL.. TA/RA AS RQRD | PM

GENERAL

Ident.: PRO-SPO-PBCS-00024647.0001001 / 08 JUL 19
Applicable to: ALL

GENERAL

The Performance-Based Communication and Surveillance (PBCS) concept provides performance requirements for communication and surveillance operations. PBCS supports the required performance for Air Traffic Management (ATM).

The PBCS concept sets the following performance parameters:
- The Required Communication Performance (RCP) specification that defines performance requirements associated to a communication transaction. A communication transaction is performed between the ATC controller and the flight crew (clearance, flight information, or request).
  Performance requirements are specified for each part of the communication chain (aircraft, air/ground network, and ATC). The RCP specification impacts CPDLC and SATCOM voice communications on the aircraft.
- RCP specification is identified by a designator (e.g. RCP 240, RCP 400) where the value refers to the maximum time (in seconds) for the ATC controller to initiate an ATC clearance and receive the response from the flight crew.
- The Required Surveillance Performance (RSP) specification that defines performance requirements associated to the delivery of surveillance data. Performance requirements are specified for each part of the communication chain (aircraft, air/ground network, and ATC). The RSP specification impacts ADS-C and SATCOM voice communications on the aircraft.

RSP specification is identified by a designator (e.g. RSP 180, RSP 400) where the value refers to a maximum time (in seconds) to deliver the surveillance data (e.g. aircraft position) to the ATC.
The RCP and/or RSP specifications apply to a defined airspace, route, or procedure with optimized operations (e.g. reduced separations).

REQUIREMENTS

Ident.: PRO-SPO-PBCS-00024648.0001001 / 08 NOV 18
Applicable to: ALL

REQUIREMENTS

Aircraft Performance Capability for Communication and Surveillance	**Required Onboard Configuration to Maintain Aircraft Performance Capability**	
	Applications that Support Aircraft Performance Capability	**Communication Means that Support Applications**
RCP 240	CPDLC	VHF datalink or SATCOM datalink
RCP 400	CPDLC	HF datalink

Continued on the following page

Continued from the previous page

Aircraft Performance Capability for Communication and Surveillance	**Required Onboard Configuration to Maintain Aircraft Performance Capability**	
	Applications that Support Aircraft Performance Capability	**Communication Means that Support Applications**
RSP 180	ADS-C	VHF datalink or SATCOM datalink
RSP 400	ADS-C	HF datalink

PROCEDURE

Ident.: PRO-SPO-PBCS-00024649.0001001 / 02 MAR 18
Applicable to: ALL

MANAGEMENT OF DEGRADED DATALINK COMMUNICATION AND SURVEILLANCE

In PBCS airspace with RCP/RSP requirements, if the ATC datalink application or the communication means associated to a required RCP/RSP level are lost, the flight crew should notify ATC that RCP and/or RSP capability are lost.

INTRODUCTION

Ident.: LIM-INT-00022265.0001001 / 17 AUG 17
Applicable to: ALL

This FCOM chapter contains operational limitations, related to the aircraft and associated systems.
All references to airspeed, Mach and altitude relate to indicated airspeed, indicated Mach, and pressure altitude, unless otherwise noted.

MAXIMUM TAILWIND FOR TAKEOFF

Maximum tailwind for takeoff.. 15 kt

Ident.: LIM-AG-OPS-ARPT_WIND-00022294.0001001 / 06 NOV 14

MAXIMUM TAILWIND FOR LANDING

Maximum tailwind for landing.. 10 kt

Ident.: LIM-AG-OPS-ARPT_WIND-00022287.0001001 / 06 NOV 14

MAXIMUM WIND FOR CABIN AND CARGO DOORS OPERATION

Maximum wind for cabin and cargo doors operation .... 40 kt
The cabin and cargo doors must be closed before the wind reaches 60 kt.

Intentionally left blank

MAXIMUM FLAPS/SLATS SPEEDS

Ident.: LIM-AG-SPD-00005762.0001001 / 06 MAY 15
Applicable to: ALL

FLAPS Lever Position	Configuration on Slat/Flap display	Max Speed	Flight Phase
0		VMO/MMO	CRUISE
1	1	255 kt	HOLDING
	1+F	220 kt (1)	TAKEOFF / APPROACH
2	2	212 kt	TAKEOFF / APPROACH
3	3	195 kt	TAKEOFF / APPROACH / LANDING
FULL	FULL	186 kt	LANDING

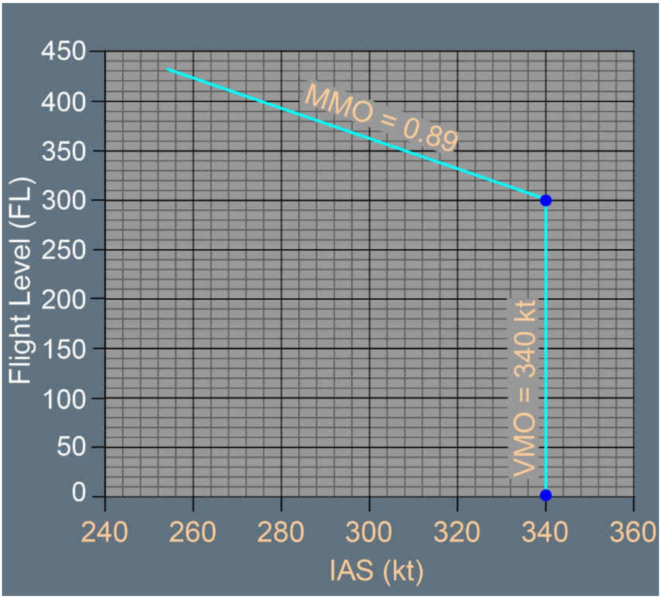
(1) *In CONF 1+F, when the aircraft reaches a speed of 210 kt, the Automatic Retraction System (ARS) automatically retracts the flaps to CONF 1.*

MAXIMUM OPERATING SPEED VMO/MMO

Ident.: LIM-AG-SPD-00005760.0001001 / 06 NOV 14
Applicable to: ALL

VMO...340 kt
MMO...0.89

VMO/MMO



The maximum operating limit speed VMO/MMO must not be intentionally exceeded in any regime of flight.

MAXIMUM SPEEDS WITH THE LANDING GEAR EXTENDED

Ident.: LIM-AG-SPD-00005764.0003001 / 02 MAY 18
Applicable to: ET-AVE, ET-AWM, ET-AWN, ET-AWO, ET-AWP, ET-AYA, ET-AYB

Maximum speed with the landing gear extended (VLE/MLE)..250 kt / M 0.55
Maximum speed with the landing gear operating (VLO/MLO).......................................250 kt / M 0.55

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00016264.0034001 / 03 JAN 19
Applicable to: ET-AWM, ET-AWN, ET-AWO, ET-AWP

Multiple Weight Variants are certified.
A placard installed in the cockpit must indicate the current MTOW.

Weight Variant: WV 016		
Maximum Taxi Weight	278 900 kg	614 869 lb
Maximum Takeoff Weight (MTOW)	278 000 kg	612 885 lb
Maximum Landing Weight (MLW)	207 000 kg	456 356 lb
Maximum Zero Fuel Weight (MZFW)	195 700 kg	431 444 lb
Minimum Weight for Takeoff	144 000 kg	317 466 lb
Minimum Weight for Landing and in Flight	127 000 kg	279 987 lb

Note:
- *MTOW, MLW, and MZFW vary with the center of gravity.*
- *In exceptional conditions (in-flight turnback or diversion), an immediate landing at a weight above maximum landing weight is permitted, provided that the flight crew follows the overweight landing procedure.*

Weight Variant: WV 011		
Maximum Taxi Weight	255 900 kg	564 162 lb
Maximum Takeoff Weight (MTOW)	255 000 kg	562 178 lb
Maximum Landing Weight (MLW)	207 000 kg	456 356 lb
Maximum Zero Fuel Weight (MZFW)	195 700 kg	431 444 lb
Minimum Weight at Takeoff	144 000 kg	317 465 lb
Minimum Weight at Landing and in Flight	127 000 kg	279 987 lb

Note:
- *MTOW, MLW, and MZFW vary with the center of gravity.*
- *In exceptional conditions (in-flight turnback or diversion), an immediate landing at a weight above maximum landing weight is permitted, provided that the flight crew follows the overweight landing procedure.*

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00016264.0033001 / 10 SEP 18
Applicable to: ET-AYA, ET-AYB

Weight Variant: WV 016		
Maximum Taxi Weight	278 900 kg	614 869 lb

Continued on the following page

Continued from the previous page

Maximum Takeoff Weight (MTOW)	278 000 kg	612 885 lb

Maximum Zero Fuel Weight (MZFW)	195 700 kg	431 444 lb
Minimum Weight at Takeoff	144 000 kg	317 465 lb
Minimum Weight at Landing and in Flight	127 000 kg	279 987 lb

Note:
- *MTOW, MLW, and MZFW vary with the center of gravity.*
- *In exceptional conditions (in-flight turnback or diversion), an immediate landing at a weight above maximum landing weight is permitted, provided that the flight crew follows the overweight landing procedure.*

TAKEOFF WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00024408.0003001 / 04 JUN 18
Applicable to: ALL

TAKEOFF WEIGHT LIMITATIONS

Condition	Limitation
TOW below 160 t (352 750 lb) and crosswind above 25 kt	D12, D16, D20, or D24 derated takeoff is mandatory
TOW below 175 t (385 809 lb) and takeoff performed in CONF 3	FLEX takeoff is not permitted

Intentionally left blank

LIMITATIONS

AIR BLEED/COND/PRESS/VENT

Intentionally left blank

APU Bleed Use with HP Air Start Unit........ A
Differential Pressure........ B
Packs Use with LP Air Conditioning Unit........ C
Ram Air Inlet........ D

Intentionally left blank

APU BLEED USE WITH HP AIR START UNIT

Ident.: LIM-AIR-00022007.0001001 / 06 NOV 14
Applicable to: ALL

Do not use bleed air from the APU BLEED and from the HP Air Start Unit at the same time, to prevent any adverse effect on the Bleed Air System (BAS).

DIFFERENTIAL PRESSURE

Ident.: LIM-AIR-00017979.0001001 / 06 NOV 14
Applicable to: ALL

Maximum positive differential pressure... 10.29 PSI
Maximum negative differential pressure..-0.72 PSI

L2 These two operating limitations correspond to the settings of the Negative Relief Valve and the Overpressure Relief Valve.

PACKS USE WITH LP AIR CONDITIONING UNIT

Ident.: LIM-AIR-00018078.0001001 / 06 NOV 14
Applicable to: ALL

Do not use conditioned air from the packs and from the LP Air Conditioning Unit at the same time, to prevent any adverse effect on the Air Conditioning system.

RAM AIR INLET

Ident.: LIM-AIR-00018064.0001001 / 06 NOV 14
Applicable to: ALL

The ram air inlet opens, only if the differential pressure is below 2 PSI.

LIM-AFS-20 ILS CAT II/III	H	2	Introduction of the "Alert height" for CAT III A operations, to be in accordance with the ICAO definition.

Intentionally left blank

GENERAL

Applicable to: ALL

Ident.: LIM-AFS-10-G10-00013044.0001001 / 06 NOV 14

AUTOPILOT

The autopilot can be used with the following minimum values:

At takeoff	At least 5 s after lift-off
After manual go-around	100 ft AGL
In approach with F-G/S mode	200 ft AGL
In approach with V/S or FPA mode	200 ft AGL
In approach with APP-DES mode	200 ft AGL
In approach with G/S mode and APPR1 on FMA	160 ft AGL
In approach with G/S mode and one of the following on FMA: - LAND1 - LAND2 - LAND3 SINGLE - LAND3 DUAL.	0 ft AGL if autoland 80 ft AGL if manual landing (1)
In all other flight phases	500 ft AGL

(1) *This value is an operating limitation recommended by Airbus (not an AFM limitation).*

The use of AP or FD in OP DES or DES is not permitted, if the AFS CP selected altitude is set below MDA(H)/DA(H), or 500 ft AGL, whichever is higher.

Ident.: LIM-AFS-10-G10-00005745.0001001 / 06 NOV 14

AUTOTHRUST

All AP/FD modes may be used with or without autothrust, except if specified.
Autothrust may be used with, or without AP/FD, in selected or managed speed/Mach.

Ident.: LIM-AFS-10-G10-00022271.0002001 / 06 NOV 14

FLIGHT MANAGEMENT

- The FMS lateral and vertical navigation is approved for after takeoff, en route and terminal area operations and for instrument approach procedures and missed approach procedures.
- The FLS (FMS Landing System) function is certified for instrument approach procedures using FMS navigation alone or FMS navigation associated with LOC, or ILS (G/S out), or LOC-BC. The FLS function is not certified for ILS, GLS, IGS, LDA, and SDF approaches or for RNAV(GNSS) final approaches with LP/LPV Minimum.
- The SLS function is certified for RNAV(GNSS) final approaches with LP/LPV Minimum.

- The FMS lateral navigation (NAV mode) is certified for instrument approach procedures except ILS, GLS, IGS, ILS (G/S out), LOC, LOC-BC, LDA, SDF final approaches and RNAV(GNSS) final approaches with LNAV/VNAV Minimum or LP/LPV Minimum.
- Approval of the FMS is based on the assumption that the navigation database is validated for intended use. The airworthiness approval does not account for database accuracy or compatibility.
  Obstacle clearance and adherence to airspace constraints remains a flight crew responsibility.
  Fuel, time predictions/performance information is provided for advisory purpose only.
  For instrument procedures not coded in the WGS 84 coordinate system, the GPS must be deselected, unless the shift between the local coordinate system and the WGS 84 is found acceptable for the intended operation.

  Note: *1. The assessment of this shift can be done:*

  - *In flight, monitoring the navaid raw data in non RNAV procedures*
  - *On ground performing a GNSS survey of the procedure waypoints.*

  2. The navigation performance for RNAV(GNSS) procedures is demonstrated based on WGS 84 coordinates.

Ident.: LIM-AFS-10-G10-00021668.0001001 / 06 NOV 14

NAVIGATION PERFORMANCE

For Advanced RNP operations with RF leg capability requiring RNP strictly below 1 NM, the FD and/or AP must be engaged and the numerical cross track deviations must be monitored on navigation display.
The above limitation does not concern RNP AR operations.

■ **With NAV PRIMARY:**
The RNP accuracy is:

	With AP ON - In NAV (all phases) - In F-LOC (approach phase)	**With AP OFF and FD ON** - In NAV (all phases) - In F-LOC (approach phase)	**With AP OFF and FD OFF**
En route	1 NM	1 NM	1 NM
Terminal area	0.5 NM	0.5 NM	0.5 NM
In approach	0.3 NM	0.3 NM	0.5 NM with F-LOC deviation. Not authorized without F-LOC deviation.

- **For RNP AR:**

  The minimum approved/certified RNP AR level is 0.10 NM. RNP AR performance requires AP ON and the following modes:
  - Departure in NAV mode
  - Initial / Intermediate approach in NAV mode
  - Final approach in NAV and APP-DES modes
  - Missed approach in NAV mode.

  Note: *1. For RNP AR operations limited to RNP 0.3 NM only, the flight crew may consider AP OFF and FD ON. However, Airbus recommends the use of AP for all RNP AR operations.*
  2. The transition from a RNP AR VIA to an approach which is not RNP AR is submitted to operational approval.

■ **Without NAV PRIMARY**

The navigation accuracy is demonstrated provided that the appropriate RNP value is checked or entered on the MFD and HIGH accuracy is displayed.

USE OF FLS AND FLS CAPABILITY

Applicable to: ALL

Ident.: LIM-AFS-10-20-00022273.0001001 / 06 NOV 14

APPROACH BASED ON RADIO NAVAIDS

A navaids approach (e.g. VOR/DME) may be flown with the FLS provided that:
- F-APP capability is displayed on FMA.
  In this case, the reference navaids may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided an operational approval is obtained.
- F-APP + RAW capability is displayed on FMA.
  In this case, the reference navaids and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

An ILS (G/S out), ILS-BC (G/S out), LOC, LOC-BC approach may be flown with the lateral LOC (LOC-BC) mode and with the F-G/S mode of FLS function provided that:
- F-APP capability is displayed on FMA.
  In this case, the reference navaids used for the vertical path validation must be tuned and checked at final descent point.
- F-APP + RAW capability is displayed on FMA.
  In this case, the reference navaids used for the vertical path validation must be tuned and checked at final descent point and monitored during the approach.

RNAV(GNSS) APPROACH

An RNAV(GNSS) approach with LNAV minimum may be flown with the FLS provided that the F-APP capability is displayed on FMA.
An RNAV(GNSS) approach with LNAV/VNAV minimum must be flown with the FLS provided that the F-APP capability is displayed on FMA.

Note: *The RNAV(GNSS) approach limitations and procedures must be used to perform an RNAV approach for which the GNSS is not required.*

Ident.: LIM-AFS-10-20-00022275.0001001 / 06 NOV 14

FLS CAPABILITY

The following table presents the FLS capability, as monitored by the FG, in accordance with required conditions:

Required Conditions	FLS Capability		
	RAW ONLY	F-APP + RAW	F-APP
FMC	1	1	1
Navigation Accuracy	No requirement	ACCURACY HIGH in one FMS	NAV PRIMARY in one FMS
MMR With FLS function	1	1	1
MMR With GNSS reception	0	0	1
ADIRU	1	1	2
FMS and GNSS position consistency	No requirement	Yes	Yes

USE OF APP-DES MODE

Ident.: LIM-AFS-10-00022277.0001001 / 06 NOV 14
Applicable to: ALL

The use of APP-DES vertical mode is certified for RNAV(RNP) final approaches, provided that the RNP AR capability is compliant with the selected procedure.
The use of APP-DES vertical mode is not permitted for RNAV(GNSS) with LNAV or LNAV/VNAV or LP/LPV minima, or for approaches based on navaids.

USE OF NAV MODE

Ident.: LIM-AFS-10-00022272.0001001 / 06 NOV 14
Applicable to: ALL

AFTER TAKEOFF

NAV mode may be used after takeoff provided that:
- NAV PRIMARY is available, or
- The flight crew check of FMS runway position update.

IN TERMINAL AREA

NAV mode may be used in terminal area provided that:
- NAV PRIMARY is available, or
- HIGH accuracy is displayed and the appropriate RNP is checked or entered on the MFD, or
- Aircraft navigation is crosschecked with navaids.

APPROACH BASED ON RADIO NAVAIDS

A navaids approach (e.g. VOR/DME) may be flown in NAV mode provided that:
- NAV PRIMARY is available.
  In this case, the reference navaids may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided that an operational approval is obtained
- NAV PRIMARY is not available.
  In this case, the reference navaids and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

RNAV(GNSS) APPROACH

An RNAV(GNSS) approach with LNAV minimum may be flown in NAV mode provided that NAV PRIMARY is available.

Intentionally left blank

GENERAL

Ident.: LIM-AFS-20-00021666.0004001 / 03 JUL 20
Applicable to: ALL

For automatic landing, one autopilot at least must be engaged in APPR mode, LAND1, LAND2 or LAND3 SINGLE or LAND3 DUAL capability must be displayed on the FMA and the configuration must be CONF 3 or CONF FULL.

Note: *Automatic approach and automatic landing have been demonstrated with one engine inoperative in CONF 3 and CONF FULL, if engine out procedures are completed before reaching 1 000 ft in approach.*

Minimum aircraft weight: 140 000 kg (308 647 lb).

Note: *Depending on the situation (e.g. emergency or other) and provided that the runway is approved for automatic landing, the flight crew can decide to perform an autoland up to the maximum takeoff weight.*

AIRPORT CONDITIONS

Automatic landing is demonstrated, as follows:
- With an airport elevation up to 9 200 ft
- With a glide slope angle between -2.5 ° and -3.5 °.

1 RUNWAY CONDITIONS

CAT IIIB operation is not authorized on contaminated runways.
The performance of the ROLL OUT mode is demonstrated on dry and wet runways (up to 3 mm of water). The roll out performance on contaminated runways has not been demonstrated and cannot be assured.

Therefore, if the flight crew aims to keep AP engaged during rollout on a contaminated runway, they must apply all of the following:
- Consider the maximum crosswind value that is the most restrictive (associated either with the runway condition, or with autoland)
  L2 For more information on the maximum crosswind value for landing associated with the runway condition, *Refer to FCOM/Maximum Crosswind for Takeoff and Landing*.
- L1 Be prepared to disengage the AP and take over manually should ROLL OUT directional control become inadequate.

WEATHER CONDITIONS

Maximum wind conditions:
- Maximum tailwind: *Refer to LIM-AG-OPS Maximum Tailwind for Landing*
- Maximum headwind: 40 kt
- Maximum crosswind: 30 kt

Note: *Wind limitation is based on the surface wind reported by the tower. If the ND indicates a current wind speed that exceeds the above-noted autoland limitations, but the tower reports a surface wind speed within the limitations, then the flight crew can perform an automatic landing. If the tower reports a surface wind speed beyond the limits, the flight crew can only perform a CAT I or CAT II automatic approach without autoland.*

SPECIAL AUTHORIZATION CAT I (SA CAT I)

Ident.: LIM-AFS-20-00022924.0001001 / 06 NOV 18
Applicable to: ALL

APPLICABLE TO AIRCRAFT EQUIPPED WITH HUD ◁

Minimum decision height..150 ft
At least one autopilot must be engaged down to DH in APPR mode and LAND2, LAND3 SINGLE or LAND3 DUAL must be displayed on the FMA.
The flight crew must use the HUD to monitor the approach.
The flight crew should perform a manual landing.

LOWER THAN STANDARD CAT I (LTS CAT I)

Ident.: LIM-AFS-20-00022925.0001001 / 06 NOV 18
Applicable to: ALL

APPLICABLE TO AIRCRAFT EQUIPPED WITH HUD ◁

Minimum decision height..200 ft
The flight crew must use the HUD to monitor the approach.
The flight crew should perform a manual landing.

ILS CAT I AND ILS CAT II/III WITH NO LVP

Ident.: LIM-AFS-20-00022354.0001001 / 06 NOV 14
Applicable to: ALL

Automatic landing system performance is demonstrated with CAT II and CAT III ILS airport installation. However, ILS CAT I automatic landing can be performed on ILS CAT I airport installation, or on CAT II/III airport installation when Low Visibility Procedure (LVP) are not applicable, provided that the following precautions are taken:

- The airline checked that the ILS beam quality, and the effect of the terrain profile before the runway have no adverse effect on autopilot guidance. Particularly, the effect of terrain profile within 300 m before the runway threshold must be evaluated
- The flight crew is aware that LOC or G/S beam fluctuations, independent of the aircraft system, may occur. The PF is prepared to immediately disconnect the autopilot, and to take the appropriate action, should not satisfactory guidance occur
- At least LAND2 capability is displayed on the FMA and the flight crew use CAT II/III procedures
- Visual references are obtained at a DH appropriate for the ILS CAT I approach. If not, a go-around must be performed.

GLS CAT I

Ident.: LIM-AFS-20-00021664.0001001 / 06 NOV 18
Applicable to: ALL

GLS CATEGORY I APPROACH

Minimum decision height ....200 ft

- **Without automatic landing**
  One AP and/or FD must be engaged in APPR mode and APPR1 or LAND1 approach and landing capability must be displayed on FMA.
- **With automatic landing**
  One AP at least must be engaged in APPR mode and LAND1 approach and landing capability must be displayed on FMA.

SPECIAL AUTHORIZATION CAT II (SA CAT II)

Ident.: LIM-AFS-20-00022926.0001001 / 06 NOV 18
Applicable to: ALL

Minimum decision height...100 ft

At least one autopilot must be engaged in APPR mode and LAND2, LAND3 SINGLE or LAND3 DUAL must be displayed on the FMA.

With HUD ◁ , the flight crew must use the HUD to monitor the approach and perform an automatic landing or a manual landing. If the flight crew performs an automatic approach without automatic landing, the autopilot must be disengaged no later than at 80 ft AGL.

Without HUD, the flight crew must perform an automatic landing.

OTHER THAN STANDARD CAT II (OTS CAT II)

Ident.: LIM-AFS-20-00022927.0001001 / 06 NOV 18
Applicable to: ALL

Minimum decision height..100 ft
At least one autopilot must be engaged in APPR mode and LAND2, LAND3 SINGLE or LAND3 DUAL must be displayed on the FMA.
With HUD ◁ , the flight crew must use the HUD to monitor the approach and perform an automatic landing or a manual landing. If the flight crew performs an automatic approach without automatic landing, the autopilot must be disengaged no later than at 80 ft AGL.
Without HUD, the flight crew must perform an automatic landing.

ILS CAT II/III

Ident.: LIM-AFS-20-00021665.0001001 / 07 JUL 20
Applicable to: ALL

CATEGORY II AUTOMATIC APPROACH WITH OR WITHOUT AUTOMATIC LANDING

Minimum decision height ....100 ft
One AP at least must be engaged in APPR mode and LAND2, LAND3 SINGLE or LAND3 DUAL approach and landing capability must be displayed on FMA.

2 CATEGORY III WITH DH AT OR ABOVE 50 FT AUTOMATIC APPROACH WITH AUTOMATIC LANDING

Minimum decision height..50 ft
Alert height (if LAND3 DUAL is displayed on FMA)........................200 ft AGL
One AP at least must be engaged in APPR mode and LAND3 SINGLE or LAND3 DUAL approach and landing capability must be displayed on FMA.

CATEGORY III WITH DH BELOW 50 FT OR NO DH AUTOMATIC APPROACH WITH AUTOMATIC LANDING

Decision height..Below 50 ft or no DH
Alert height..200 ft AGL
Two AP must be engaged in APPR mode and LAND3 DUAL approach and landing capability must be displayed on FMA.

REQUIRED EQUIPMENT FOR GLS ◁ CAT I APPROACH WITH AUTOLAND

Ident.: LIM-AFS-20-00021785.0001001 / 30 JAN 18
Applicable to: ALL

Prior to initiating a CAT I GLS approach ◁ with autoland, the flight crew should check that the equipment or functions below-listed are available:

Required Equipment Not Monitored by FG	GLS With Autoland
AP pb, or CAPT sidestick pushbutton, or F/O sidestick pushbutton	2
Autoland light	1
AP OFF alert	Available
DA/DH Indication	1 for PM
Attitude indication on PFD	2
Attitude indication on standby instrument	1
Windshield wiper, or rain repellent	1 for PF
Windshield heating	1 for PF

In addition, the Flight Guidance (FG) monitors other required equipment, and computes the approach capability. The loss of a required equipment, monitored by the FG, is announced by an assigned alert (e.g. NAV RA SYS A+B+C FAULT), or by the AUTO FLT APPROACH CAPABILITY DOWNGRADED alert.

L2 The following table presents equipment, monitored by the FG, required to perform a GLS CAT I approach with autoland:

Required Equipment Monitored by FG	GLS LAND1
AP	1 AP engaged
PRIM	1
Normal law for yaw, pitch, and roll	Available
Rudder trim and rudder position	Available
AFS CP, or CAPT AFS CP backup, or F/O AFS CP backup	1
PFD display	2
RA and MMR display on PFD	Available
FWS, including the audio function	1
Ground spoilers	Available
Radio Altimeter	1
MMR tuned with GLS channel	2
ADR	2
IRS in NAV mode	2

REQUIRED EQUIPMENT FOR ILS CAT II/III APPROACH WITH AUTOLAND

Ident.: LIM-AFS-20-00005757.0005001 / 07 JUN 19
Applicable to: ET-AWO, ET-AWP, ET-AYA, ET-AYB

Prior to initiating an ILS CAT II/III approach with autoland, the crew should check that the equipment or functions listed in the following table are available:

Required Equipment Not Monitored by FG	LAND2	LAND3 SINGLE	LAND3 DUAL
AP pb, or CAPT sidestick pushbutton, or F/O sidestick pushbutton	2	2	2
Autoland light	1	1	1
AP OFF alert	Available	Available	Available
DH Indication	1 for PM	1 for PM	1 for PM
Attitude indication on PFD	2	2	2
Attitude indication on standby instrument	1	1	1
Windshield wiper, or rain repellent	1 for PF	1 for PF	1 for PF
Windshield heating	1 for PF	1 for PF	1 for PF

In addition, the FG monitors other required equipment, and computes the approach capability. The loss of a required equipment, monitored by the FG, is announced by an assigned alert (e.g. NAV RA SYS A+B+C FAULT), or by the AUTO FLT APPROACH CAPABILITY DOWNGRADED alert.

L2 The following table presents equipment, monitored by the FG, required to perform an ILS CAT II or CAT III approach with autoland:

L23

Required Equipment Monitored by FG	LAND2	LAND3 SINGLE	LAND3 DUAL
AP	1 AP engaged	1 AP engaged	2 APs engaged
A/THR	Not required	Active	Active
PRIM	1	1	2
SEC	SEC 2 or SEC 3	SEC 2 or SEC 3	SEC 2 or SEC 3
North reference	MAG	MAG	MAG
Slat and Flap Systems	(SLAT SYS 1 and FLAP SYS 1) or (SLAT SYS 2 and FLAP SYS 2) (4)	(SLAT SYS 1 and FLAP SYS 1) or (SLAT SYS 2 and FLAP SYS 2) (4)	(SLAT SYS 1 and FLAP SYS 2) or (SLAT SYS 2 and FLAP SYS 1) (4)
Elevator	1	1	1
Rudder actuation, rudder position and rudder trim	Available	Available	Available
Normal or Alternate law	Available	Available	Available
Hydraulic circuit	1	1	2
AFS CP, or CAPT AFS CP backup, or F/O AFS CP backup	1	1	1
PFD display	2	2	2

Nosewheel Steering *(1)*	Not required	Not required	Available
Ground spoilers	Available	Available	Available
Radio Altimeter	1	2	2
MMR tuned with ILS frequency *(2)*	2	2	2
ADR	2	2	2
IRS in NAV mode	2	2	3
Angle of Attack	2	2	3
Engine	1	1	1
AC busbar	*(3)*	*(3)*	4
Supply of AC busbars	*(3)*	*(3)*	2 independent AC busbars
Supply of DC busbars	*(3)*	*(3)*	2 independent DC emergency busbars

(1) *In LAND3 DUAL, the nosewheel steering must be able to receive AP guidance orders.*

(2) *In addition, the tuning of both ILS must be consistent.*
If the tuning of both ILS in MMR is not consistent, the NAV LS TUNING DISAGREE alert triggers.

(3) *In accordance with the failure, and the associated equipment loss, capability downgrade may occur.*

(4) *The approach and landing capability downgrades to APPR1 if all of the following are applicable:*
- *A failure leads to the loss of the Slat system (i.e. F/CTL SLAT SYS 1+2 FAULT) or to the loss of the Flap system (i.e. F/CTL FLAP SYS 1+2 FAULT)*
- *The configuration is not set to CONF 3 or CONF FULL.*

REQUIRED EQUIPMENT FOR ILS CAT II/III APPROACH WITH AUTOLAND

Ident.: LIM-AFS-20-00005757.0002001 / 31 MAY 18
Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB, ET-AVC, ET-AVD, ET-AVE, ET-AWM, ET-AWN

Prior to initiating an ILS CAT II/III approach with autoland, the crew should check that the equipment or functions listed in the following table are available:

Required Equipment Not Monitored by FG	**LAND2**	**LAND3 SINGLE**	**LAND3 DUAL**
AP pb, or CAPT sidestick pushbutton, or F/O sidestick pushbutton	2	2	2
Autoland light	1	1	1

APU Start/Shutdown During Refueling/Defueling..B
Operational Envelope..C

Intentionally left blank

GENERAL

Applicable to: ALL

Ident.: LIM-APU-10-00022309.0001001 / 13 JAN 15

OIL QUANTITY

The APU may be started and operated even if the OIL LEVEL LO ECAM advisory is displayed. Maintenance action is required within 20 h of APU operation.

Ident.: LIM-APU-10-00022308.0001001 / 06 NOV 14

APU START

After three consecutive APU start attempts, the flight crew must wait 60 min before a new start attempt.

Ident.: LIM-APU-10-00022310.0001001 / 06 NOV 14

ROTOR SPEED

Maximum N speed.. 106 %

Ident.: LIM-APU-10-00022311.0001001 / 06 NOV 14

EGT

Maximum EGT for APU start.. 1 260 °C
Maximum EGT for APU running..680 °C

APU START/SHUTDOWN DURING REFUELING/DEFUELING

Ident.: LIM-APU-00021937.0001001 / 06 NOV 14
Applicable to: ALL

An APU start is not permitted during a refuel/defuel procedure if the APU has failed to start or an automatic shutdown has occurred.
A normal APU shutdown must be completed if a fuel spill has occurred during the refuel/defuel procedure.

OPERATIONAL ENVELOPE

Ident.: LIM-APU-00013182.0001001 / 06 NOV 14
Applicable to: ALL

APU ELECTRIC GENERATOR

The electric generator of the APU can operate in the entire flight envelope.

APU BLEED

Max altitude to assist engine start.. 25 000 ft

Max altitude for air conditioning and pressurization (single pack operation)........................ 25 000 ft
Max altitude for air conditioning and pressurization (dual pack operation)...........................22 500 ft
Use of APU bleed air for wing anti-ice is not permitted.

Applicable to: ET-ATQ, ET-ATR, ET-ATY, ET-AUA, ET-AUB, ET-AUC, ET-AVB

The use of the Head Up Display (HUD) is approved for all phases of flight with the following limitations:

MANUAL APPROACH

The HUD may be used for visual, or CAT I approaches, provided that the selected slope is between -2 ° and -4 °

AUTOMATIC APPROACH, LANDING AND ROLLOUT

The HUD may be used for monitoring an automatic approach, landing and rollout.

Note: *Following automatic approach and landing, the HUD is approved as a reversionary means for rollout in the event of untimely autopilot disconnection or failure of a system affecting automatic rollout.*

VERTICAL DISPLAY (VD)

Ident.: LIM-CDS-00022279.0001001 / 06 NOV 14
Applicable to: ALL

The Vertical Display (VD) is provided for advisory purpose only. It is not a primary means of vertical navigation.

THRUST SETTING/EGT LIMITS

Ident.: LIM-ENG-00016268.0001001 / 04 DEC 14
Applicable to: ALL

Operating Conditions		Time Limit	EGT Limit
Takeoff and Go-around	All engines operative	5 min	900 °C
	One engine inoperative	10 min	
Maximum Continuous Thrust (MCT) (1)		Not limited	850 °C
Starting	On ground		700 °C
	In flight		850 °C

(1) *Applicable to engine failure.*

SHAFT SPEEDS

Ident.: LIM-ENG-00016270.0004001 / 03 JAN 19
Applicable to: ALL

Maximum N1 (FAN MARK I)......98.1 %
Maximum N1 (FAN MARK II)......99.1 %

L2 *Note:* *The N1 Red Limit value that appears on the Engine Display is set according to the maximum N1. In the case of an engine intermix (between Fan Mark I and Fan Mark II), the Engine Display may indicate a different N1 Red Limit for each engine.*

L1 Maximum N2...... 100.4 %
Maximum N3...... 98.8 %

OIL

Ident.: LIM-ENG-00016269.0001001 / 03 JUL 20
Applicable to: ALL

OIL TEMPERATURE

Maximum continuous temperature...... 180 °C
Minimum starting temperature......-40 °C
Minimum temperature before takeoff...... 50 °C

OIL PRESSURE

Minimum oil pressure......25 PSI

1 OIL QUANTITY

Minimum oil quantity......13 quarts

Note: One of the following actions or oil system characteristics can cause indications of reduced oil quantity on the ENG SD page:
- *If oil drains from the oil tank to the engine after oil servicing, or*
- *If an engine crank or an engine run is performed on the engine before the flight.*

As a result, if the oil quantity indicated on the ENG SD page is less than the minimum oil quantity defined above, perform one of the following:
- *Check that the oil tank level, that is reported in the technical logbook, is above the minimum oil quantity, or*
- *Check in the technical log book that the oil tank was fully filled.*

STARTER

Ident.: LIM-ENG-00016271.0001001 / 31 JUL 18
Applicable to: ALL

Maximum continuous starter operation is 5 min:
- Two consecutive cycles of 3 min maximum, plus one additional cycle of 1 min, with a run down to zero N3 and wait 30 s between each cycle, or
- One 5 min cycle.

Wait 30 min after the last cycle to allow the starter to cool.
No running engagement of the starter when the N3 is above 10 % on ground, or 30 % in flight.

REVERSE THRUST

Ident.: LIM-ENG-00008852.0001001 / 06 NOV 14
Applicable to: ALL

- Selection of the reverse thrust is prohibited in flight
- Backing the aircraft with reverse thrust is not permitted
- Maximum reverse should not be used below 70 kt (or when the indication starts to fluctuate). Idle reverse is allowed down to aircraft stop.

REDUCED THRUST TAKEOFF

Ident.: LIM-ENG-00008853.0001001 / 04 MAY 16
Applicable to: ALL

Takeoff at reduced thrust, so-called as FLEX takeoff, is allowed only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is allowed with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:

- Higher than TMAXFLEX, equal to ISA + 60. TMAXFLEX corresponds to a reduction of 40 % from the full rated takeoff thrust.
- Lower than the flat rating temperature (TREF), equal to:
  - ISA + 15, for pressure altitudes below 2 000 ft
  - ISA + 10, for pressure altitudes between 4 000 ft and 8 000 ft
  - ISA + 15, for pressure altitudes above 10 000 ft
  - For pressure altitudes between 2 000 ft and 4 000 ft, and for pressure altitudes between 8 000 ft and 10 000 ft, TREF is determined by linear interpolation between ISA + 10 and ISA + 15.
- Lower than the actual OAT.

DERATED TAKEOFF

Ident.: LIM-ENG-00019848.0002001 / 24 MAY 17
Applicable to: ALL

Selection of TOGA thrust is not permitted when a derated takeoff is performed, except when requested in any abnormal or emergency procedures.
The use of reduced thrust takeoff (FLEX takeoff) is not permitted in conjunction with derated takeoff.
The use of derated takeoff is permitted regardless of the runway condition (dry, wet or contaminated).

SOFT GO-AROUND

Ident.: LIM-ENG-00019849.0001001 / 06 NOV 14
Applicable to: ALL

The use of GA SOFT mode is prohibited with one engine inoperative.

MAXIMUM TAXI TIME IN FZFG CONDITIONS

Ident.: LIM-ENG-00024239.0001001 / 29 JAN 19
Applicable to: ALL

Outside Air Temperature (OAT)	Engine Stator A-ICE Valve Operative or Failed Open	Engine Stator A-ICE Valve Failed Closed
-9 °C (16 °F) ≤ OAT < 1 °C (34 °F)	120 min max engines operation	No Dispatch (1)
OAT below -9 °C (16 °F)	80 min max engines operation	

(1) *Cancel takeoff and request the maintenance crew to perform:*
- *An engine section stator anti-ice valve inspection,*
- *The VIGV inspection, and if necessary a manual engine core deicing.*

ENGINE WARM-UP BEFORE TAKEOFF

Ident.: LIM-ENG-00024061.0001001 / 13 DEC 16
Applicable to: ALL

The engines must warm up at idle or taxi thrust before takeoff.

IF ENGINES WERE SHUT DOWN 90 MIN OR LESS:

Warm-up Time.. 2 min

IF ENGINES WERE SHUT DOWN MORE THAN 90 MIN:

Warm-up Time.. 5 min

Ident.: LIM-LG-00022002.0001001 / 06 NOV 14
Applicable to: ALL

The braking system is not designed to hold the aircraft in a stationary position when a high thrust level is applied on at least one engine. During ground procedures that require a thrust increase with braking, the flight crew must ensure that the aircraft remains stationary.

BRAKE PIVOT TURN

Ident.: LIM-LG-00022306.0001001 / 06 NOV 14
Applicable to: ALL

Braked pivot turn is prohibited (i.e. differential braking cannot be used to fully stop one main gear).

BRAKE TEMPERATURE

Ident.: LIM-LG-00022001.0001001 / 06 NOV 14
Applicable to: ALL

Maximum brake temperature for takeoff... 300 °C

LANDING GEAR GRAVITY EXTENSION RESET

Ident.: LIM-LG-00022356.0001001 / 06 NOV 14
Applicable to: ALL

The landing gear gravity extension reset function must not be used in flight.

CAUTION	The landing gear gravity extension must be reset only on ground by maintenance personnel.

MAXIMUM SPEEDS WITH THE LANDING GEAR EXTENDED

Ident.: LIM-LG-00022098.0001001 / 06 NOV 14
Applicable to: ALL

Refer to LIM-AG-SPD Maximum Speeds with the Landing Gear Extended.

MAXIMUM TIRE SPEED

Ident.: LIM-LG-00022112.0001001 / 06 NOV 14
Applicable to: ALL

Refer to LIM-AG-SPD Maximum Tire Speed.

PARKING BRAKE

Ident.: LIM-LG-00022332.0001001 / 06 NOV 14
Applicable to: ALL

Use of parking brake while aircraft is moving is prohibited unless in emergency.

TAXI WITH DEFLATED OR DAMAGED TIRES

Ident.: LIM-LG-00023092.0001001 / 07 JAN 16
Applicable to: ALL

To vacate the runway or taxi with one or more deflated or damaged tires all of the following limitations apply:

- Maximum taxi speed: 3 kt
- Maximum nosewheel steering angle: 30 °
- No more than one affected tire on the nose landing gear
- No more than two affected tires on each main landing gear provided that the affected tires are not on the same axle.

In addition, if tire damage is suspected, the flight crew must ask for an aircraft inspection prior to vacate the runway or taxi. If the ground crew suspects that a tire burst may damage the landing gear, maintenance action is due.
For more information, *Refer to FCTM/PR-AEP-LDG Taxi with Deflated Tires*.

BACKUP STEERING FUNCTION

Ident.: LIM-LG-00022548.0001001 / 03 OCT 17
Applicable to: ALL

The Backup Steering Function (BSF) must not be used:

- On contaminated runways,
- For more than 90 ° turns,
- To perform more than 2 turns.

When the BSF activates, do not use manual differential braking or differential thrust to steer the aircraft unless required for controllability at the end of the rollout.

LIMITATIONS

Intentionally left blank

AIRPORT NAVIGATION FUNCTION (ANF)

Ident.: LIM-NAV-00022281.0001001 / 06 NOV 14
Applicable to: ALL

GENERAL

The use of the airport moving map is approved for certain flight phases only.

Note: *Direct visual observation out of the cockpit windows remains the primary means of taxiing. The flight crew must always use external reference indications during aircraft taxi. They must never use the ANF instead of these external reference indications.*

TAXI

The use of the airport moving map is authorized on both PF and PM displays.

TAKEOFF

The use of the airport moving map is not authorized on PF display.

GO-AROUND, CRUISE, DESCENT AND APPROACH UNTIL TOUCHDOWN

The use of the airport moving map is authorized on either PF or PM display for BTV.

ROLL OUT AFTER TOUCHDOWN

The use of the airport moving map is authorized on both PF and PM displays.

INERTIAL REFERENCE SYSTEM (IRS)

Ident.: LIM-NAV-00022305.0001001 / 06 NOV 14
Applicable to: ALL

IR GROUND ALIGNMENT

Ground alignment of the IRS is possible in latitudes between 82 ° North and 78.25 ° South.

MAGNETIC (MAG) / TRUE REFERENCE

In NAV mode, the IR will not provide valid magnetic heading and magnetic track angle:
- North of 82 ° North
- North of 73 ° North between 90 ° and 120 ° West (magnetic polar region)
- South of 60 ° South.

When flying at latitudes beyond these limits, TRUE reference must be selected.

Minimum Flight Crew Oxygen Pressure.....A

Intentionally left blank

MINIMUM FLIGHT CREW OXYGEN PRESSURE

Ident.: LIM-OXY-00019742.0003001 / 09 JUL 15
Applicable to: ALL

The following table provides the minimum oxygen pressure. It is the responsibility of the Operator to ensure that the minimum oxygen pressure complies with the intended aircraft operations.

Flight Crewmembers	Minimum Oxygen Pressure displayed on DOOR SD page (PSI)	
	CAPT Indication	F/O Indication
CAPT + F/O	750	750
CAPT + F/O + 3rd Occupant	750	1050
CAPT + F/O + 4th Occupant	1050	750
CAPT + F/O + 3rd Occupant + 4th Occupant	1050	1050

For more information on the third and fourth occupant seats, *Refer to Cockpit Seats*.

FLIGHT ABOVE FL 410

For FAA-certified aircraft, and in accordance with FAR 121.333, if flight above FL 410 is expected:

- Before departure, the flight crew must increase the minimum oxygen bottle pressure. The amount of the increase is based on the amount of time that the aircraft will be above FL 410. For calculation purposes, the minimum oxygen pressure must be increased by 150 PSI per hour
- When the aircraft goes above FL 410, one flight crewmember must don the oxygen mask, and set the regulator to normal position (diluted oxygen).

LIMITATIONS

ROW/ROP - BTV

Intentionally left blank

BTV.. A
ROW/ROP...B

Intentionally left blank

BTV

Ident.: LIM-ROW-ROP-00020512.0002001 / 03 APR 17
Applicable to: ALL

For landing on a contaminated runway, the flight crew must set the LDG PERF CODE at or below 4 (COMP SNOW - GOOD TO MEDIUM), regardless of the available airport reports (e.g. Pilot Report of Braking Action = Good or Estimated Surface Friction = Good).

Note: *The flight crew must pay attention to the validity of the reported depth of contamination at the time of landing.*

L2 For more information about:
- The definition of the landing performance equivalent to wet, *Refer to PER-LDG-30 Contaminated Runway*
- The runway condition assessment matrix, *Refer to PER-LDG-30 Runway Condition Assessment Matrix for Landing*
- The selection of a runway condition, *Refer to DSC-34-32-20-20-70 RWY CONDITION/BRAKING ACTION Matrix*.

ROW/ROP

Applicable to: ALL

Ident.: LIM-ROW-ROP-10-00020511.0002001 / 03 APR 17

The ROW/ROP is certified :
- On dry, wet and contaminated runways,
- With thrust reversers available,
- Without failure affecting landing performance.

Note: *In the case of a failure affecting landing performance, the ROW/ROP alerts are available. The ROW/ROP alerts are based on landing performance that does not take into account the performance penalties linked to the alert that impacts the landing performance. The flight crew must always follow the ROW/ROP alerts.*

Ident.: LIM-ROW-ROP-10-00022329.0001001 / 05 JUN 18

Operations where the ROW landing distance is above the LDA ("TOO SHORT" indication displayed on the ND) must not be conducted unless a specific authorization is obtained from the appropriate authority to deactivate the ROW/ROP for these operations.

In this case, the flight crew must deactivate the ROW/ROP via either:

- The ROW/ROP pb-sw ◁ on the SURV overhead panel ◁ , or
- The TERR SYS button on the MFD SURV page, if the ROW/ROP pb-sw ◁ is not installed. In this case, the flight crew must deactivate the ROW/ROP when the aircraft position is less than 15 NM from the airfield.

Ident.: LIM-ROW-ROP-10-00024128.0002001 / 05 JUN 18

CONTAMINATED RUNWAY

LDG PERF CODE SELECTION

For landing on a contaminated runway, the flight crew must set the LDG PERF CODE at or below 4 (COMP SNOW - GOOD TO MEDIUM), regardless of the available airport reports (e.g. Pilot Report of Braking Action = Good or Estimated Surface Friction = Good).

Note: *The flight crew must pay attention to the validity of the reported depth of contamination at the time of landing.*

Intentionally left blank

TERRAIN AWARENESS AND WARNING SYSTEM (TAWS)

Ident.: LIM-SURV-00022107.0001001 / 06 NOV 14
Applicable to: ALL

Aircraft navigation is not to be predicated upon the use of the terrain display.
The terrain display is intended to serve as a situation awareness tool only, and may not provide the accuracy on which to solely base terrain avoidance maneuvering.

The TAWS function should be inhibited (TERR SYS button set to OFF on the MFD SURV/CONTROLS page):

- For operations from/to runways not incorporated into the TAWS database
- For specific approach procedures, which have previously been identified as potentially producing false terrain alerts. The TAWS should be inhibited when the aircraft position is less than 15 NM from the airfield.

INTRODUCTION

Ident.: PER-PN1-00024296.0001001 / 06 FEB 18
Applicable to: ALL

The main goal of the Pitch/N1 tables is to reinforce flight crew awareness about the pitch/N1 thrust value. This is in order to safely fly in the complete domain of flight in normal and abnormal situations. All tables have been computed for a CG of 30 %.

For extreme CG values, expect maximum variations in terms of both of the following:
- For forward CG: +2 % N1 and +5 kt.
- For aft CG: -2 % N1 and -5 kt.

CLIMB IN CLEAN CONF

Ident.: PER-PN1-00023760.0001001 / 06 FEB 18

Intentionally left blank

GENERAL

Ident.: PER-TOF-10-00017742.0001001 / 06 AUG 14
Applicable to: ALL

The takeoff performance optimization is the process which aims at obtaining:
- The maximum performance limited takeoff weight (MTOW (perf))
- The optimum takeoff thrust for a given weight.

The takeoff performance is optimized for a given runway, the associated obstacles, the flaps setting, the prevailing outside conditions (temperature, wind, and QNH) and the aircraft status.

The takeoff performance optimization process:
- Takes into account the parameters that affect takeoff performance
- Optimizes the parameters for which there is a possible range of values or settings

L2 The takeoff performance optimization process is made with the takeoff performance (T.O PERF) application.
For more information on the T.O PERF application, *Refer to DSC-46-OIS-20-80-90 T.O PERF*.

TAKEOFF PARAMETERS

Ident.: PER-TOF-10-00021524.0001001 / 03 JAN 19
Applicable to: ALL

The takeoff performance parameters are:
- The characteristics of the runway

L2
  - Declared lengths (TORA, TODA, ASDA)
  - Elevation
  - Slope
  - Obstacles.

L1
- The regulatory requirements
- The line up distances as applicable
- The outside conditions

L2
  - Outside Air Temperature (OAT)
  - Wind

L3
    Maximum tailwind is limited to a certified value. There is no maximum certified value for headwind, however a headwind higher than 40 kt brings no additional performance credit.
    As per regulation, the computation is based on 150 % of the entered tailwind, and 50 % of the entered headwind.
    A maximum crosswind component is associated with each runway condition.
    For more information on crosswind limitations, *Refer to LIM-AG-OPS Maximum Crosswind for Takeoff and Landing*.
    In addition, the flight crew applies a different thrust setting technique during the takeoff procedure when the crosswind component exceeds a threshold value, which affects the calculation of the takeoff distance.
    For more information on the takeoff procedure, *Refer to PRO-NOR-SOP-120 Takeoff - Thrust Setting*.

L2
  - QNH
  - Runway condition.

L1
- The aircraft configuration

L2
  - Aerodynamic configuration
  - Air conditioning setting
  - Anti-ice selection
  - Thrust setting.

L1
- The aircraft status

L2
  - MEL items
  - CDL items.

L1 - The takeoff speeds.

L2
- V1
- VR
- V2.

L1 The following parameters can be optimized:
- Aerodynamics configuration
- Air conditioning
- Thrust setting

L2
- TOGA
- FLEX
- Derate levels.

L1 - Takeoff speeds.

L2 Among the takeoff performance parameters that can be optimized, the takeoff speeds optimization has the largest potential for gain of takeoff weight. The range for optimization varies from 0.84 to 1.0 for V1/VR ratio and from 1.13 to 1.4 for V2/VS1G ratio.

Intentionally left blank

TOGA THRUST

Ident.: PER-TOF-20-10-00017759.0001001 / 06 AUG 14
Applicable to: ALL

TOGA is the maximum thrust certified for takeoff.
When all engines are operative, the TOGA thrust rating must not be used more than 5 min.
In the case of one engine out, the TOGA thrust rating may be used for a maximum of 10 min.

The flight crew must use TOGA thrust for takeoff if at least one of the following conditions applies:
- Maximum power is required
- Performance reasons
- Flexible takeoff and derated takeoff are not permitted.

Intentionally left blank

General

GENERAL

Ident.: PER-TOF-20-20-10-00017760.0001001 / 06 AUG 14
Applicable to: ALL

The actual takeoff weight of the aircraft is often lower than the maximum regulatory takeoff weight. In this case, it may be possible to takeoff at a thrust less than the maximum takeoff thrust. This allows to increase the engine life, improve the engine reliability and reduce the maintenance costs.

Two categories of takeoff at reduced thrust exist:
- The use of flexible temperature concept referred to as flexible takeoff
- The use of a fixed derated thrust level referred to as derated takeoff.

Intentionally left blank

Flexible Takeoff

FLEXIBLE TAKEOFF DEFINITION

Ident.: PER-TOF-20-20-20-00017761.0001001 / 06 AUG 14
Applicable to: ALL

When the actual takeoff weight is lower than the maximum performance limited takeoff weight, the aircraft may comply with the regulatory requirements with a reduced thrust, called flexible takeoff thrust.
This takeoff operation is the FLEX takeoff.

FLEXIBLE TAKEOFF PRINCIPLE

Ident.: PER-TOF-20-20-20-00021543.0001001 / 06 AUG 14
Applicable to: ALL

The FLEX takeoff principle is based on the change in maximum available thrust with OAT.
The maximum performance limited takeoff weight depends on the maximum available takeoff thrust, therefore it is possible to determine a temperature at which the actual takeoff weight would be limited by performance.
This temperature is referred to as TFLEX (Flex Temperature).

Flexible Takeoff Principle

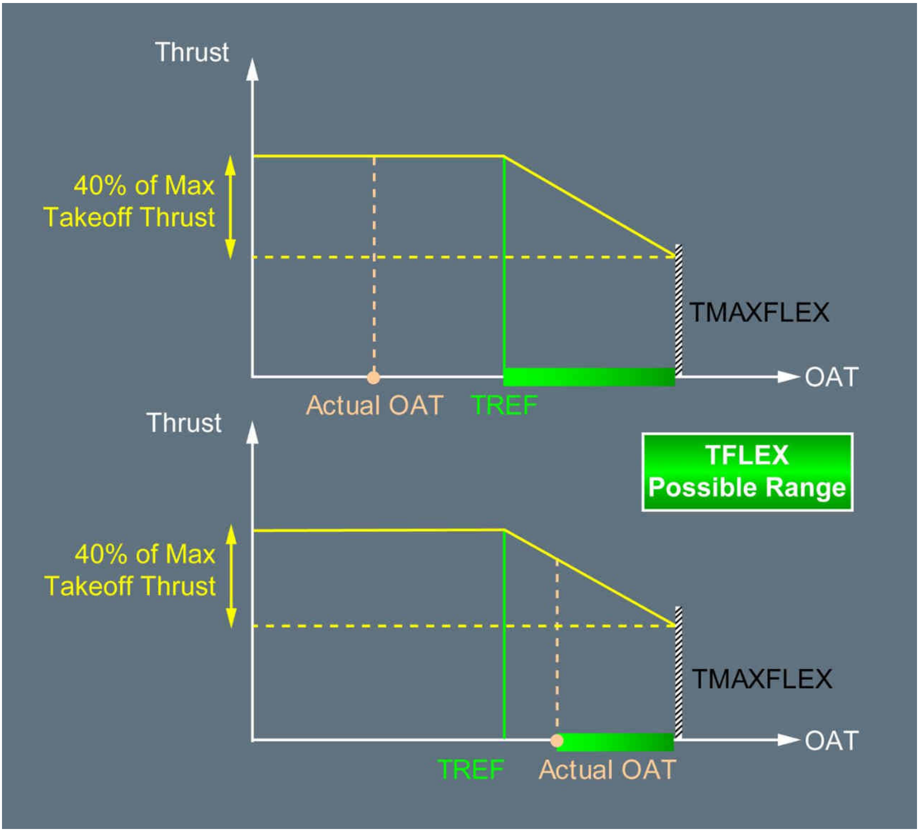
FLEXIBLE TAKEOFF LIMITATIONS

Ident.: PER-TOF-20-20-20-00017762.0001001 / 06 SEP 17
Applicable to: ALL

Takeoff at reduced thrust, so-called as FLEX takeoff, is allowed only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 60. TMAXFLEX corresponds to a reduction of 40 % from the full rated takeoff thrust.
- Lower than the flat rating temperature (TREF), equal to:
  - ISA + 15, for pressure altitudes below 2 000 ft
  - ISA + 10, for pressure altitudes between 4 000 ft and 8 000 ft
  - ISA + 15, for pressure altitudes above 10 000 ft
  - For pressure altitudes between 2 000 ft and 4 000 ft, and for pressure altitudes between 8 000 ft and 10 000 ft, TREF is determined by linear interpolation between ISA + 10 and ISA + 15.
- Lower than the actual OAT.

TFLEX Limitations



Thrust

FLEX takeoff is not permitted on contaminated runways.
Some items listed in the MEL and CDL do not permit a flexible takeoff.

L2 The operator should check the maximum thrust (TOGA) by:

- Performing full-rated takeoffs at regular intervals, in order to detect a reduced EGT margin, or
- Maintaining an adequate engine monitoring program, in order to follow-up on the engine parameters.

Derated Takeoff

DERATED TAKEOFF DEFINITION

Ident.: PER-TOF-20-20-30-00017764.0001001 / 06 MAR 15
Applicable to: ALL

A derated takeoff is defined as the takeoff operation at a thrust setting lower than TOGA, for which the AFM provides a set of takeoff limitations and performance data.
Six derate levels are available (04, 08, 12, 16, 20 and 24 %).

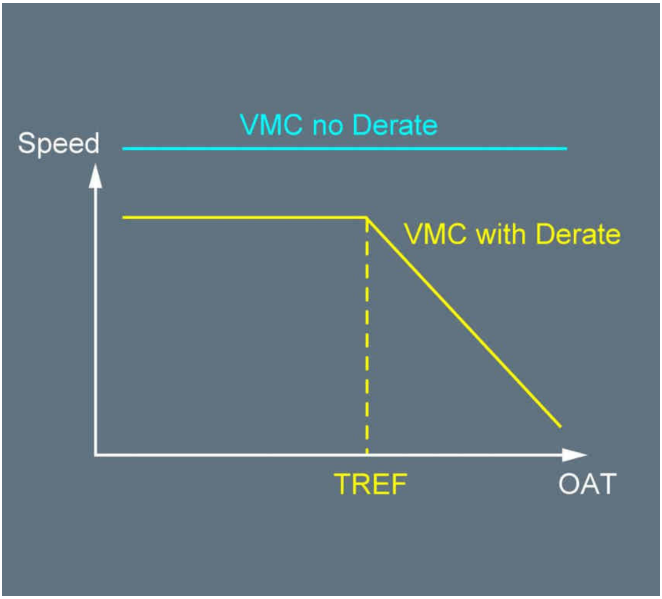
DERATED TAKEOFF PRINCIPLE

Ident.: PER-TOF-20-20-30-00017765.0001001 / 06 AUG 14
Applicable to: ALL

The derated takeoff enables to improve the takeoff performance if the TOW is limited by VMCG. VMCG limitation usually occurs on short and/or contaminated runways. The principle is to impose a lower engine rating to benefit from lower minimum control speeds.

L2 In the case of derated takeoff, the minimum control speeds (VMCG and VMCA) are decreased because:
- The derated thrust is lower than the maximum takeoff thrust
- The effect of temperature on maximum available thrust is taken into account.

Derated Takeoff Principle



VMCG LIMITING

VMCG only has an impact on the ASD that includes an acceleration and a deceleration phase. The decrease in VMCG allows to use lower V1 values in the speed optimization, which shortens both the acceleration and the deceleration distances.

The weight decrement linked to the derated thrust is largely compensated by the benefit of shorter ASD. As a consequence, if takeoff performance is limited by the VMCG limited weight, an overall improvement can be achieved by derating.

VMCA LIMITING

The penalizing effect on climb gradient of the decrease in thrust outweighs the advantage of a lower VMCA.
Therefore derated takeoff would not improve the takeoff weight if VMCA limited.

DERATED TAKEOFF LIMITATIONS

Ident.: PER-TOF-20-20-30-00017766.0001001 / 04 DEC 14
Applicable to: ALL

It is not permitted to combine a derated takeoff and a FLEX takeoff.
When a derated takeoff is performed, the selection of full takeoff thrust, by setting thrust levers to TOGA, is not permitted below the speeds specified in the "Engine Failure After V1 - Continued Takeoff Operating Technique". The only exception is the Recovery Technique at takeoff after the penetration of unforecast windshear.

L2 For more information on the specified speeds, *Refer to FCTM/PR-AEP-ENG Procedure*.

DESCRIPTION

Ident.: PER-TOF-30-10-00021528.0001001 / 03 JUL 20
Applicable to: ALL

1 A runway is dry when its surface is:
- Free of visible moisture
- Not contaminated.

PERFORMANCE CALCULATION

Ident.: PER-TOF-30-10-00015893.0001001 / 06 AUG 14
Applicable to: ALL

Takeoff performance is calculated without the benefit of thrust reversers, as per regulation.
Flexible takeoff and derated takeoff are allowed for a takeoff from a dry runway.

Intentionally left blank

DESCRIPTIONS

Ident.: PER-TOF-30-20-00011356.0001001 / 03 JUL 20
Applicable to: ALL

1 2 WET RUNWAY

A runway is considered as wet, when the surface is covered by any visible moisture or water up to and including 3 mm (1/8") depth. When the water film does not exceed 3 mm (1/8"), there is no significant danger of hydroplaning.

Note: *A damp runway is considered wet, regardless of whether or not the surface has a shiny appearance.*

PERFORMANCE CALCULATION

Ident.: PER-TOF-30-20-00014338.0001001 / 03 JUL 20
Applicable to: ALL

3 Takeoff performance on a wet runway can be calculated with the benefit of thrust reversers. However, it is not allowed to take off at a weight higher than the weight on dry runway.
Flexible takeoff and derated takeoff are allowed for a takeoff from a wet runway.

L2 For information on contaminants equivalent to wet runway, *Refer to PER-TOF-30-30 Performance Calculation*.

Intentionally left blank

DESCRIPTIONS

Ident.: PER-TOF-30-30-00014339.0001001 / 07 NOV 16
Applicable to: ALL

A runway is contaminated when more than 25 % of its surface is covered with:
- A layer of fluid contaminant not considered as thin
- A hard contaminant.

FLUID CONTAMINANT

In terms of performance, a contaminated runway is a runway covered by a fluid contaminant with a depth of more than 3 mm (1/8"). The fluid contaminant can be either:
- Dry snow
- Wet snow
- Standing water
- Slush.

Fluid Contaminants reduce friction forces, and cause:
- Precipitation drag
- Hydroplaning.

L2 Fluid contaminants descriptions:
- Dry snow is snow that, if compacted by hand, does not stay compressed when released. The wind can blow dry snow. The density of dry snow is approximately 0.2 kg/l (1.7 lb/US Gal).
- Wet snow is snow that, if compacted by hand, stays compressed when released, and with which snowballs can be created. The density of wet snow is approximately 0.4 kg/l (3.35 lb/US Gal).
- Standing water occurs due to heavy rain and/or not sufficient runway drainage. Standing water has a depth of more than 3 mm.
- Slush is snow soaked with water, which spatters when stepped on firmly. Slush occurs at temperatures of approximately 5 °C, and has a density of approximately 0.85 kg/l (7.1 lb/US Gal).

L1 HARD CONTAMINANT

In terms of performance, a contaminated runway is a runway covered by a hard contaminant that can be either:
- Compacted snow,
- Ice (Cold and Dry)
- Wet ice.

Hard contaminants only reduce friction forces.

L2 Hard contaminants descriptions:
- Compacted snow: the maintenance personnel use a snow groomer to compress the snow on a runway in order to obtain a hard surface

- Ice (Cold and Dry): situation in which ice occurs on the runway in cold and dry conditions
- Wet ice: when the ice on a runway melts, or there are loose/fluid contaminants on top of the ice, the ice is referred to as "wet ice". When there is wet ice on a runway, braking and directional control are difficult or not possible, because the runway surface is very slippery.

PERFORMANCE CALCULATION

Ident.: PER-TOF-30-30-00015894.0001001 / 08 JUL 19
Applicable to: ALL

Takeoff performance on contaminated runways can be calculated with the benefit of thrust reversers. However, it is not allowed to take off at a weight higher than the weight on a dry runway.

For fluid contaminants, takeoff performance data are provided up to the following depths:
- Dry snow: 100 mm (4")
- Wet snow: 20 mm (4/5")
- Standing water: 15 mm (3/5")
- Slush: 15 mm (3/5").

L2 The following assumptions are considered for the calculation:
- The contaminant covers the entire length of the runway in a layer that has a uniform depth and density.
- The friction coefficient is based on studies, and verified by tests
- The screen height at the end of the takeoff segment is 15 ft, instead of 35 ft.

L1 Derated takeoff is allowed on contaminated runways.

EQUIVALENCES

In terms of performance:
- A fluid contamination is equivalent to wet, up to a maximum depth of 3 mm (1/8") of:
  - dry snow
  - wet snow
  - standing water
  - slush.
- "Frost" is equivalent to wet, unless a lower runway performance code is reported.

RESTRICTIONS

Ident.: PER-TOF-30-30-00021544.0001001 / 06 AUG 14
Applicable to: ALL

FLEX takeoff is not permitted on contaminated runways.
Dispatch from and to a runway covered with wet ice is not permitted, unless an effective friction coefficient at or higher than 0.07 is demonstrated.

TAKEOFF WITH MEL OR CDL ITEM

Ident.: PER-TOF-40-00014680.0001001 / 06 MAR 15
Applicable to: ALL

The aircraft can be dispatched with deferred MEL or CDL items.

MEL or CDL items that affect takeoff performance are:
- MEL items that reduce braking capabilities (brakes, spoilers, thrust reversers)
- MEL items that have an effect on thrust available (engine anti-ice valve stuck open)
- MEL items that may lead to a reduced systems efficiency (rudder actuator, DFS, EDP)
- CDL items that increase aircraft drag (seals, fairings).

L2 CDL items are divided in two categories: negligible and non-negligible items.
If the number of negligible CDL items is less or equal to three, no penalty applies.
If the number of negligible CDL items is more than three, a drag increase for each item is applied.

Intentionally left blank

TAKEOFF RECOMMENDATIONS

Ident.: PER-TOF-50-00017758.0001001 / 06 AUG 14
Applicable to: ALL

TAKEOFF CONFIGURATION

As a general rule, CONF 1+F gives better performance on long runways (better climb gradient), whereas CONF 3 gives better performance on short runways (shorter takeoff distances).
Sometimes, other parameters, such as obstacles can interfere. In this case, a compromise between climb and runway performance is requested, making CONF 2 the optimum configuration for takeoff.
Environmental takeoff conditions may also impact the choice of the takeoff configuration.
The following takeoff configuration is then recommended:

OUTSIDE CONDITIONS	FLAPS SETTINGS	OBJECTIVE
Dry or wet, well-paved runway	Use the flaps setting that provides the optimum performance. If takeoff weight is not limited by performance, consider using the higher flaps setting. *Note:* *Corresponds to OPT CONF selection in T.O PERF*	To extend engine life and save maintenance costs
High altitude takeoff	Use CONF 2 or CONF 3	To improve comfort
Badly-paved runway, or accelerate stop distance limited runway	Use CONF 2 or CONF 3	To improve comfort and stopping distance

FLEXIBLE TAKEOFF

Flexible takeoff is the recommended method for takeoff at reduced thrust on dry and wet runways.
The highest flexible temperature (TFLEX) extends engine life and saves maintenance costs.
However, if a high TFLEX is reduced by a few degrees only, the engines are not significantly affected.
The highest TFLEX will usually be obtained at the lowest flap setting. However, a higher flaps setting provides a lower decision speed (V1) and more comfort.
To extend engine life and to save maintenance costs, the use of flaps setting that provides the highest TFLEX is recommended. However, when the difference (in terms of TFLEX) between two configurations is low, the highest of both takeoff configurations is preferable.

IN-FLIGHT PERFORMANCE CALCULATION

Ident.: PER-IFT-10-00020638.0001001 / 03 SEP 14
Applicable to: ALL

Performance data are split by flight phases: climb, cruise, descent, and holding.
In-flight performance calculation is made with the in-flight performance application (IN-FLT PERF).
For more information on IN-FLT PERF application, *Refer to DSC-46-OIS-20-80-100 IN-FLT PERF*.

Intentionally left blank

General

GENERAL

Ident.: PER-IFT-20-10-10-00020641.0001001 / 03 SEP 14
Applicable to: ALL

The climb phase starts at the end of takeoff and ends at the initial cruise level.

The available thrust options are:
- AUTO-DERATE: the FMS automatically computes the appropriate reduced level of climb thrust,
- CLB: maximum climb thrust.

Intentionally left blank

Climb Thrusts

AUTO-DERATED CLIMB THRUST

Ident.: PER-IFT-20-10-20-00020642.0001001 / 05 NOV 18
Applicable to: ALL

The AUTO-DERATE function automatically reduces the thrust during the climb phase. The reduced thrust level is computed by the FMS to have similar performance level as a reference case, corresponding to the climb to REC MAX ALT at MTOW with MCL thrust.
The function reduces as much as possible the thrust to give the same time to climb to the cruise altitude as the reference case. It guarantees also a minimum climb capability and a limited impact on the fuel consumption.
The level of thrust is optimized by the FMS as a function of the aircraft weight (TOW or GW), the target cruise altitude (CRZ FL) and the ISA deviation at cruise altitude (CRZ TEMP).
The AUTO-DERATE function is selected by default in the FMS. It corresponds to the option AUTO-DERATE in the CLB THR list of the FMS ACTIVE/PERF page. The auto-derated climb thrust mode is engaged when it is selected in the FMS ACTIVE/PERF page and the thrust levers are set to CL detent position.

If necessary, the flight crew can disengage the auto-derated climb thrust mode during PREFLIGHT, T.O or CLB FMS flight phases by one of the following actions:
- To move the thrust levers from CL to MCT detent and back to CL, or
- To select CLB in the CLB THR list of the FMS ACTIVE/PERF page.

The AUTO-DERATE option does not affect the climb ceiling as the Maximum Climb thrust (MCL) is automatically recovered before reaching the REC MAX ALT.

The AUTO-DERATE function allows to systematically reduce the thrust during the climb phase and has the following economical advantages:
- Increased engine life
- Improved engine reliability
- Reduced direct maintenance costs.

MAXIMUM CLIMB THRUST

Ident.: PER-IFT-20-10-20-00021743.0001001 / 03 SEP 14
Applicable to: ALL

The “Maximum Climb” thrust rating is the maximum thrust approved for normal climb.
The FADEC commands this rating when the thrust lever is on the CL detent and the flight crew has selected CLB in the CLB THR list of the FMS ACTIVE/PERF page.

Intentionally left blank

Speeds

ECONOMIC MACH NUMBER (ECON MACH)

Ident.: PER-IFT-20-20-10-00019551.0001001 / 01 OCT 15
Applicable to: ALL

COST INDEX

The Cost index (CI) is defined as the ratio between Cost of Time per time unit (CT) and Cost of Fuel per mass unit (CF).
The CI value is expressed in kilograms per minute (kg/min), or hundreds of pounds per hour (100 lbs/hr).
The purpose of the CI concept is to reduce Direct Operating Costs (DOC).

ECON MACH

For a given CI, ECON Mach is defined as the Mach for which DOC are minimum.

LONG RANGE CRUISE SPEED (LRC)

Ident.: PER-IFT-20-20-10-00019552.0001001 / 03 SEP 14
Applicable to: ALL

The Long Range Cruise speed (LRC) is defined as the Mach number for which the specific range is equal to 99 % of the maximum specific range.
L2 For more information, *Refer to DSC-22-FMS-10-50-20 FMS Speed Mode (ECON/LRC)*.

FIXED SPEED

Ident.: PER-IFT-20-20-10-00019553.0001001 / 03 SEP 14
Applicable to: ALL

The fixed speed is either a Mach or a CAS.

TURBULENCE SPEED

Ident.: PER-IFT-20-20-10-00019555.0001001 / 03 SEP 14
Applicable to: ALL

Turbulence speeds are recommended when the aircraft flies in a turbulent atmosphere.
The recommended turbulence speed is between Green Dot and 300 kt/M 0.85.
The MAX TURB function indicated on the MFD PERF CRZ page displays the maximal speed/Mach not to exceed according to this recommendation.

MAXIMUM SPEED

Ident.: PER-IFT-20-20-10-00019556.0001001 / 03 SEP 14
Applicable to: ALL

Maximum speed is either:

- The Maximum Operating Mach (MMO), or
- The Maximum Operating speed (VMO), or
- The speed limited by the available thrust.

L2 For more information on Maximum Speed, *Refer to LIM-AG-SPD Maximum Operating Speed VMO/MMO*.

Altitude/Ceilings

DEFINITIONS

Ident.: PER-IFT-20-20-20-00019557.0001001 / 03 SEP 14
Applicable to: ALL

OPTIMUM ALTITUDE

The optimum altitude (OPT ALT) is the altitude at which the SR is maximum.

REC MAX

Maximum altitude is defined as the lower of:
- Maximum altitude at maximum cruise thrust in level flight
- Maximum altitude at maximum climb thrust with 300 ft/min vertical speed
- Maximum certified altitude
- 1.3 g buffet limited altitude.

ALTITUDE OPTIMIZATION

Ident.: PER-IFT-20-20-20-00019558.0001001 / 05 NOV 18
Applicable to: ALL

The optimum altitude definition depends on the cruise type.
The optimum altitude (OPT) displayed on the FMS-PERF page and the optimum altitude (OPTIMUM ALT) determined by the OIS IN-FLT PERF Cruise computation for a given Cost Index (CI) are the result of a minimum cost analysis. To determine these optimum altitudes, both the FMS and IN-FLT PERF calculate the value of the Cost Function (CF) based on the CI at 500 ft increment altitudes. The altitude that provides the lowest value for the CF is displayed as OPT on the FMS-PERF page and as OPTIMUM ALT on the OIS IN-FLT PERF.
These optimum altitude computations take into account a large number of parameters. The FMS and the OIS consider some of these parameters in a different manner. Therefore, OPT on the FMS and OPTIMUM ALT on the OIS may differ.

L2 The main contributor to any difference between OPT on the FMS and OPTIMUM ALT on the OIS is the wind.

Intentionally left blank

GENERAL

Ident.: PER-IFT-20-30-00020649.0001001 / 03 SEP 14
Applicable to: ALL

The descent phase starts at the top of descent and ends at landing or level off.
In the case of an emergency descent, MMO/VMO is the best speed profile as it gives high rate of descent, which can be increased by extending the speed brakes, if needed.

Intentionally left blank

GENERAL

Ident.: PER-IFT-20-40-00020650.0001001 / 03 SEP 14
Applicable to: ALL

The holding phase, when required, starts before the landing phase above the destination or alternate airport.
In CONF CLEAN, the standard holding speed is the green dot speed + 20 kt, as it is a good approximation of the maximum endurance speed.

Intentionally left blank

ONE ENGINE INOPERATIVE STRATEGIES

Ident.: PER-IFT-30-00019545.0001001 / 03 SEP 14
Applicable to: ALL

For more information about One Engine Inoperative Strategies, *Refer to FCTM/PR-AEP-ENG Engine Failure During Cruise*.

LONG RANGE CRUISE SPEED

Ident.: PER-IFT-30-00019546.0001001 / 03 SEP 14
Applicable to: ALL

If the EO mode of the FMS is active, the FMS takes the engine failure into account to compute the EO-LRC speed/ Mach.

EO MAX ALTITUDE

Ident.: PER-IFT-30-00019547.0001001 / 04 MAY 16
Applicable to: ALL

The FMS Engine Out Maximum (EO MAX) altitude is a precomputed value, function of the aircraft gross weight and DISA, displayed on all the PERF pages if one engine is inoperative.

L2 **EO MAX** altitude respects the following criteria:
- It can be flown with LRC speed
- It can be held in level flight with:
  - The operating engine at "Maximum Continuous Thrust" rating
  - The failed engine in windmilling
  - Anti-ice OFF
- It can be reached before buffeting with a margin of 0.3 g
- It is less than the maximum certified altitude.

HOLDING

Ident.: PER-IFT-30-00020652.0001001 / 03 SEP 14
Applicable to: ALL

In CONF CLEAN, the standard EO holding speed is the green dot speed + 20 kt.

SEVERE ICING

Ident.: PER-IFT-30-00021742.0001001 / 06 SEP 17
Applicable to: ALL

If severe icing conditions are encountered, ice may build up on non heated structure. In these conditions:

- The minimum speed is Green Dot in clean configuration
- The nominal gross OEI Level off is reduced by:
  - 4 800 ft for weights less than 188 t (414 500 lb)
  - 9 000 ft for weights more than 280 t (617 300 lb)
  - linear interpolation between 4 800 ft and 9 000 ft for intermediate values of weights.

L2 The nominal gross Level off is calculated at Green Dot speed, engines at MCT, and Anti-ice Off. The reduction in altitude takes into account the effect of activation of Engine and Wing Anti-ice, in addition to ice accretion.

FUEL PENALTY TABLES - FUEL CONSUMPTION INCREASED

Applicable to: ALL

FUEL PENALTY TABLE

L2 The fuel penalty values of the FCOM table are conservative, and provided as a guideline for both of the following:

- Increase flight crew awareness, particularly when the fuel penalty associated with the failure may change during the flight
- Help the decision making.

L1 Fuel penalties less than 3 % are neither leading to the FUEL CONSUMPT INCRSD display on the ECAM nor included in the table.
The list of INOP SYS appears in the same order of priority as it appears on the STATUS page on the ECAM.

TOTAL FUEL PENALTY : ADD TOGETHER ALL APPLICABLE LINES		
INOP SYS or ECAM Alert	**REASON FOR FUEL CONSUMPT INCRSD**	**FUEL PENALTY**
STABILIZER	Stabilizer locked	Up to 65 % (Not Variable) *(3)*

GENERAL

Ident.: PER-LDG-10-00021541.0001001 / 03 SEP 14
Applicable to: ALL

The landing performance calculation enables:

- At dispatch, to check that the aircraft can land at destination for the predicted conditions, in compliance with the regulatory requirements
- During flight, to check that the aircraft can land at destination for the actual conditions.

L2 The calculation is made in compliance with the recommendations coming from the FAA Takeoff And Landing Performance Assessment Aviation Rulemaking Group (called TALPA ARC).

The landing performance calculation is made with the landing performance (LDG PERF) application. For more information on the LDG PERF application, *Refer to DSC-46-OIS-20-80-110 LDG PERF*.

LANDING PARAMETERS

Ident.: PER-LDG-10-00016750.0001001 / 05 NOV 18
Applicable to: ALL

The landing performance parameters are:

- The characteristics of the runway
  - L2 Landing Distance Available (LDA)
  - Elevation
  - Slope
  - Missed approach gradient.
- L1 The regulatory requirements
- The outside conditions
  - L2 Wind

    L3 As per regulation, the computation is based on 150 % of the entered tailwind, and 50 % of the entered headwind.

    The crosswind component does not affect the calculation of the landing distance. However, a maximum crosswind component is associated with each runway condition.

    For more information about crosswind limitation, *Refer to LIM-AG-OPS Maximum Crosswind for Takeoff and Landing*.
  - L2 Outside Air Temperature (OAT)
  - Sea level atmospheric pressure (QNH)
  - Icing conditions (anti-ice selection)
  - Runway condition, or landing performance level.
- L1 The aircraft configuration
  - L2 Landing Weight (LW)
  - Aerodynamic configuration
  - Air conditioning setting
  - Aircraft CG position
  - Approach speed and go-around speed.
- L1 The aircraft status.
  - L2 MEL items
  - CDL items
  - Abnormal and emergency configuration (ABN EMER) for in-flight computation only.

L1 The following parameters can be optimized:

- Aerodynamics configuration
- Go-around speed.

L2 For more information about the go-around speed, *Refer to PER-LDG-20 Landing Speeds*.

Intentionally left blank

LANDING SPEEDS

Ident.: PER-LDG-20-00016524.0001001 / 03 SEP 14
Applicable to: ALL

LOWEST SELECTABLE SPEED (VLS)

VLS is the lowest selectable speed. VLS is used to determine the Final Approach Speed (VAPP) in normal conditions.
For more information about VLS, *Refer to DSC-22-27-10-20 VLS*.

REFERENCE SPEED (VREF)

VREF is equal to the VLS of CONF FULL. VREF is used to determine the Final Approach Speed (VAPP) when a system failure affects the landing performance.
For more information about VREF, *Refer to DSC-22-27-10-10 VREF*.

FINAL APPROACH SPEED (VAPP)

VAPP is the speed of the aircraft when crossing the runway threshold. The flaps/slats are in the landing configuration, and the landing gears are extended.
For more information about VAPP, *Refer to DSC-22-27-10-20 VAPP*.

GO-AROUND SPEED

In the case of a missed approach, the go-around climb gradient is calculated at the go-around speed.
The standard go-around speed is 1.23 VS1G of the go-around configuration. For approaches with a decision height at or above 200 ft, where approach climb performance is found restrictive, the go-around speed can be increased up to 1.3 VS1G of the go-around configuration.

LANDING DISTANCES DEFINITIONS

Ident.: PER-LDG-20-00021576.0001001 / 03 APR 17
Applicable to: ALL

REQUIRED LANDING DISTANCE (RLD)

The RLD is the regulatory reference to be used for dispatch landing performance computation.

The RLD is the factored certified landing distance based on:
- Maximum manual braking initiated immediately after main gear touchdown
- Prompt selection of max reverse thrust, maintained to 70 kt, and idle thrust to full stop (when credit is used)
- Antiskid system and all ground spoilers operative
- The regulatory dispatch factor.

Note: *The Required Landing Distance calculation considers the effect of the MEL/CDL items that affects the landing performance.*

IN-FLIGHT LANDING DISTANCE (LD)

The In-Flight Landing Distance reflects the performance achievable in a typical operational landing without margin.

The In-Flight Landing Distance calculation assumes:
- An airborne phase of 7 s from threshold to touchdown
- In the case of manual braking: maximum manual braking initiated immediately after main gear touchdown
- In the case of autobrake: normal system delays in braking activation
- Antiskid system and all ground spoilers operative
- Prompt selection of max reverse thrust, maintained to 70 kt, and idle thrust to full stop (when credit is used).

Note: *The In-Flight Landing Distance calculation considers the effect of the inoperative system(s) following:*

- *An MEL/CDL dispatch that affects the landing performance*
- *An in-flight failure (ECAM alert) that affects the landing performance.*

FACTORED IN-FLIGHT LANDING DISTANCE (FLD)

The definition of the In-Flight Landing Distance does not include any margin. The In-Flight Landing Distance is a realistic distance achievable in nominal conditions, i.e. the actual conditions during the landing are those used for the computation.

it is recommended to apply an appropriate margin to the In-Flight Landing Distance (either determined with or without failure) in order to cover:
- The variability in flying techniques (e.g. flare execution, delay in application of the deceleration means)
- Unexpected conditions at landing (e.g. real runway friction vs. reporting, turbulence, crosswind).

L2 The Factored In-Flight Landing Distance is defined as:
- The In-Flight Landing Distance multiplied by a Factor, or
- The In-Flight Landing Distance plus an Increment.

L1 It is the Airlines responsibility to define the margins (and their applicability) to apply on top of the In-Flight Landing Distance.
The recommended margin is a Factor of 1.15 on the In-Flight Landing Distance. Under exceptional circumstances, the flight crew may decide to disregard this margin.

ROW LANDING DISTANCE

The ROW landing distance is calculated by the PRIMs and displayed on the ANF.
For more information about the ROW system, *Refer to DSC-34-32-20-10 ROW*.

Intentionally left blank

DRY RUNWAY

Ident.: PER-LDG-30-00021599.0001001 / 03 JUL 20
Applicable to: ALL

1 A runway is dry when its surface is:
- Free of visible moisture
- Not contaminated.

WET RUNWAY

Ident.: PER-LDG-30-00021600.0001001 / 03 JUL 20
Applicable to: ALL

2

3 WET RUNWAY

A runway is considered as wet, when the surface is covered by any visible moisture or water up to and including 3 mm (1/8") depth. When the water film does not exceed 3 mm (1/8"), there is no significant danger of hydroplaning.

Note: *A damp runway is considered wet, regardless of whether or not the surface has a shiny appearance.*

CONTAMINATED RUNWAY

Ident.: PER-LDG-30-00021602.0001001 / 08 JUL 19
Applicable to: ALL

A runway is contaminated when more than 25 % of its surface is covered with:
- A layer of fluid contaminant not considered as thin
- A hard contaminant.

DESCRIPTION OF FLUID CONTAMINANTS

In terms of performance, a contaminated runway is a runway covered by a fluid contaminant with a depth of more than 3 mm (1/8"). The fluid contaminant can be either:
- Dry snow
- Wet snow
- Standing water
- Slush.

Fluid Contaminants reduce friction forces, and cause:
- Precipitation drag
- Hydroplaning.

L2 Fluid contaminants descriptions:
- Dry snow is snow that, if compacted by hand, does not stay compressed when released. The wind can blow dry snow. The density of dry snow is approximately 0.2 kg/l (1.7 lb/US Gal).
- Wet snow is snow that, if compacted by hand, stays compressed when released, and with which snowballs can be created. The density of wet snow is approximately 0.4 kg/l (3.35 lb/US Gal).
- Standing water occurs due to heavy rain and/or not sufficient runway drainage. Standing water has a depth of more than 3 mm.
- Slush is snow soaked with water, which spatters when stepped on firmly. Slush occurs at temperatures of approximately 5 °C, and has a density of approximately 0.85 kg/l (7.1 lb/US Gal).

L1 DESCRIPTION OF HARD CONTAMINANTS

In terms of performance, a contaminated runway is a runway covered by a hard contaminant that can be either:
- Compacted snow,
- Ice (Cold and Dry)
- Wet ice.

Hard contaminants only reduce friction forces.

L2 Hard contaminants descriptions:
- Compacted snow: the maintenance personnel use a snow groomer to compress the snow on a runway in order to obtain a hard surface

- Ice (Cold and Dry): situation in which ice occurs on the runway in cold and dry conditions
- Wet ice: when the ice on a runway melts, or there are loose/fluid contaminants on top of the ice, the ice is referred to as "wet ice". When there is wet ice on a runway, braking and directional control are difficult or not possible, because the runway surface is very slippery.

L1 LANDING PERFORMANCE CALCULATION

L2 COMPUTATION ASSUMPTIONS

The following assumptions are considered for the calculation:
- The contaminant covers the entire length of the runway
- For fluid contaminants, the landing distance calculation does not take credit of the precipitation drag.

L1 EQUIVALENCES

In terms of performance:
- A fluid contamination is equivalent to wet, up to a maximum depth of 3 mm (1/8") of:
  - dry snow
  - wet snow
  - standing water
  - slush.
- "Frost" is equivalent to wet, unless a lower runway performance code is reported
- "Slippery Wet" is equivalent to 10 mm (2/5") of dry snow.

RESTRICTIONS

For maximum depth of fluid contaminants, *Refer to PER-LDG-30 Runway Condition Assessment Matrix for Landing*.
Dispatch from and to a runway covered with wet ice is not permitted, unless an effective friction coefficient at or higher than 0.07 is demonstrated.

RUNWAY CONDITION ASSESSMENT MATRIX FOR LANDING

Intentionally left blank

GENERAL

Ident.: PER-LDG-40-00018372.0001001 / 13 JAN 15
Applicable to: ALL

LANDING PERFORMANCE CALCULATION

The landing performance calculation is made with the landing performance (LDG PERF) application, with the computation type set to DISPATCH.

L2 For more information on the LDG PERF application, *Refer to DSC-46-OIS-20-80-110 LDG PERF*.

L1 REQUIREMENT ON THE LANDING DISTANCE

The Landing Distance Available (LDA) at destination must be at least equal to the Required Landing Distance (RLD) for the planned landing weight.

REQUIREMENT ON THE GO-AROUND PERFORMANCE

The go-around climb gradient must be at least equal to:
- 2.1 %
- The gradient published in the airport approach chart.

Note: *EU-OPS requires a minimum go-around climb gradient of 2.5 % for instrument approaches with decision heights below 200 ft.*

DISPATCH ON DRY RUNWAY

Ident.: PER-LDG-40-00016506.0001001 / 03 SEP 14
Applicable to: ALL

Landing performance is calculated without the benefit of thrust reversers, as per regulation.

L2 For information, the AFM publishes the autoland landing distance increments on dry runways.

DISPATCH ON WET RUNWAY

Ident.: PER-LDG-40-00016509.0001001 / 03 SEP 14
Applicable to: ALL

Landing performance is calculated without the benefit of thrust reversers, as per regulation.
The RLD for a wet runway is the RLD for the dry runway multiplied by 1.15.

DISPATCH ON CONTAMINATED RUNWAY

Ident.: PER-LDG-40-00016511.0001001 / 03 SEP 14
Applicable to: ALL

Landing performance can be calculated with the benefit of the thrust reversers.
For operators complying with EU-OPS regulation, the landing weight on a contaminated runway cannot exceed the landing weight on a wet runway.

DISPATCH WITH MEL OR CDL ITEM

Ident.: PER-LDG-40-00016512.0001001 / 06 MAR 15
Applicable to: ALL

The aircraft can be dispatched with deferred MEL or CDL items. In this case, the LDA must be at least equal to the RLD calculated with the applicable MEL or CDL item selected.

MEL or CDL items that affect landing performance are:
- MEL items that reduce braking capabilities (brakes, spoilers, thrust reversers if applicable)
- MEL items that have an impact on thrust available for go-around (engine anti-ice valve stuck open)
- CDL items that increase aircraft drag (seals, fairings).

L2 CDL items are divided in two categories: negligible and non-negligible items.
If the number of negligible CDL items is less or equal to three, no penalty applies.
If the number of negligible CDL items is more than three, a drag increase for each item is applied.

IN-FLIGHT LANDING DISTANCE CROSSCHECK

Ident.: PER-LDG-40-00019134.0001001 / 03 SEP 14
Applicable to: ALL

The Factored In-Flight Landing Distance may, in some cases, and in particular on contaminated runway, exceed the RLD considered at dispatch.
The requirements for dispatch remain unchanged and are based on the RLD. However, when arrival conditions are expected to be marginal it is recommended to make a preliminary calculation of In-Flight Landing Distance or Factored In-Flight Landing Distance at dispatch in order to nominate suitable destination alternates.
The landing performance calculation may also check that the aircraft can land at destination in compliance with In-Flight Landing Distance.
In this case, the landing distance considered for dispatch is the maximum of the RLD and the Factored In-Flight Landing Distance.

ROW LANDING DISTANCE CROSSCHECK

Ident.: PER-LDG-40-00021304.0001001 / 04 DEC 14
Applicable to: ALL

The ROW landing distance may, in some cases, exceed the RLD considered at dispatch.
The requirements for dispatch remains unchanged and are based on the RLD. However, if the conditions remain unchanged, the flight crew will not be authorized to initiate an approach (unless a specific authorization is obtained from the appropriate authority to deactivate the ROW/ROP).
As a consequence, the dispatch conditions should be adapted in order to prevent a ROW alert to be triggered.

Intentionally left blank

GENERAL

Ident.: PER-LDG-50-00018097.0001001 / 03 SEP 14
Applicable to: ALL

During flight, the flight crew performs a landing performance computation if the landing conditions changed compared with the landing performance computation at dispatch, or with a previous computation (e.g. runway, weather conditions, in-flight failure affecting performance, diversion).
The landing performance calculation is made with the landing performance (LDG PERF) application, with the computation type set to IN-FLIGHT.

L2 For more information on the LDG PERF application, *Refer to DSC-46-OIS-20-80-110 LDG PERF*.

L1 The landing distance used for this computation is the Factored In-Flight Landing Distance (FLD). The flight crew uses the RCAM to determine the runway landing performance and code.
If the aircraft has been dispatched with deferred MEL or CDL items, the In-Flight Landing Distance and Factored In-Flight Landing Distance must be calculated with the applicable MEL or CDL items selected.
Under exceptional circumstances, the flight crew may decide to disregard the Factored In-Flight Landing Distance. In this case the flight crew must check that the In-Flight Landing Distance is shorter than the LDA at the destination or diversion airport.

L2 For more information on In-Flight Landing Distances, *Refer to PER-LDG-20 Landing Distances Definitions*.

LANDING PERFORMANCE WITHOUT IN-FLIGHT FAILURE

Ident.: PER-LDG-50-00019790.0001001 / 13 JAN 15
Applicable to: ALL

LANDING PERFORMANCE CALCULATION

The flight crew enters the expected landing conditions and calculates the landing performance.

L2 For more information on the LDG PERF application, *Refer to DSC-46-OIS-20-80-110 LDG PERF*.

L1 FLAPS LEVER POSITION

The FLAPS lever position for landing is at flight crew's discretion.

VAPP DETERMINATION

VAPP is calculated by the FMS and is displayed on the APPR panel of the FMS PERF page.

L2 The VAPP is calculated by the FMS as the maximum of:
- VMCL + 5 kt
- 1.23*VS1G + (5 ≤ headwind/3 ≤ 15)

LANDING PERFORMANCE FOLLOWING IN-FLIGHT FAILURE

Ident.: PER-LDG-50-00018101.0001001 / 13 JAN 15
Applicable to: ALL

LANDING PERFORMANCE ECAM INDICATIONS

After an aircraft system failure that occurs in flight, the flight crew follows the associated ECAM procedure.
When required, the ECAM displays landing performance indications in the applicable procedure.
The ECAM alert items are displayed on the ECAM STATUS page. The ECAM displays LDG DIST AFFECTED or LDG PERF AFFECTED if an ECAM alert item affects landing performance.
L2 LDG DIST AFFECTED means that only the landing distance is affected.
LDG PERF AFFECTED means that both approach speed and landing distance are affected.

L1 LANDING PERFORMANCE CALCULATION

The ECAM alert items that affect landing performance are automatically sent to the LDG PERF application. The LDG PERF application displays these items in the ACFT STATUS panel.
The flight crew enters the expected landing conditions and calculates the landing performance.
L2 For more information on the LDG PERF application, *Refer to DSC-46-OIS-20-80-110 LDG PERF*.

L1 FLAPS LEVER POSITION

The flight crew selects the FLAPS lever position requested by the ECAM.

Note: *If there are no ECAM instructions, the FLAPS lever position for landing is at flight crew's discretion.*

VAPP DETERMINATION

- **If the ECAM displays LDG DIST AFFECTED:**
  The flight crew uses the VAPP calculated by the FMS.
- **If the ECAM displays LDG PERF AFFECTED:**
  The flight crew enters into the FMS - PERF - APPR page the VAPP value computed by the LDG PERF application.

ROW LANDING DISTANCE CROSSCHECK

Ident.: PER-LDG-50-00021305.0001001 / 04 DEC 14
Applicable to: ALL

The ROW landing distance may, in some cases, exceed the factored in-flight landing distance (FLD). The flight crew will not be authorized to initiate an approach if a ROW alert is expected (unless a specific authorization is obtained from the appropriate authority to deactivate the ROW/ROP).
If a ROW alert is expected, and the flight crew is not authorized to deactivate the ROW/ROP, the flight crew should request to change the runway, or initiate a diversion.

INTRODUCTION

Ident.: OEB-000-00020937.0001001 / 29 MAR 17
Applicable to: ALL

DEFINITION

Airbus issues an **Operations Engineering Bulletin (OEB)** to rapidly inform Operators of any deviations from initial design objectives that have a significant operational effect. An OEB provides Operators with technical information and temporary operational procedures that address these deviations.

TYPES OF OEB

OEBs can be either red or white, depending on their level of priority.

Red OEBs	:	Are issued to indicate that non-compliance with the recommended procedures may have a significant impact on the safe operation of the aircraft .
White OEBs	:	Are issued to indicate that non-compliance with the recommended procedures may have a significant impact on aircraft operation.

Airbus strongly recommends that all Operators rapidly apply the OEB corrective actions as soon as they become available, particularly for red OEBs.
The information in OEBs is recommended by Airbus, but may not be approved by Airworthiness Authorities. However, in case of red OEB, Airbus also issues a Temporary Revision (TR) of the Airplane Flight Manual (AFM). If the procedures contained in the red OEB differ from the procedures in the AFM TR, the approved AFM TR remains the reference.

OEB CONTENT AND MANAGEMENT

An OEB:
- Is a part of the Flight Crew Operating Manual (FCOM)
- Is temporary, and usually focuses on one operational subject only
- Remains applicable, until the appropriate corrective actions are applied
- Is filed in increasing order.

The content of each OEB includes:
- The reason for issue
- Technical explanations of the deviation from the initial design objectives
- The operational effect, if the flight crew does not apply the OEB procedure
- The conditions to apply the OEB procedures:
  - Cockpit effect
  - Flight phases
  - Specific events.

- The OEB operational procedure(s) the flight crew must apply
- The corrective actions (i.e. the SB(s) modification) that cancel the OEB, as soon as these corrective actions become available.

If necessary, there are links to the FCOM sections for which the OEB is applicable, and these sections are usually in the format of a Temporary Documentary Unit (TDU).

OEB AND ECAM ABNORMAL & EMERGENCY PROCEDURES

OEBs do not normally apply to ECAM abnormal/emergency procedures.
The Airbus Temporary Quick Change (ATQC) database is used to urgently make any required updates or changes to an ECAM abnormal and emergency procedures.
L2 For more information on the ATQC database, *Refer to DSC-31-CDS-60-10-20 FWS*.

L1 REVIEW OF THE OEB

In accordance with the Standard Operating Procedures (SOPs), and before each flight, the flight crew must review all OEBs that are applicable to their aircraft. If the OEB conditions are applicable, the flight crew must apply the operational procedure(s) that is in the OEB.
L2 For more information on OEB review in the SOPs, (*Refer to PRO-NOR-SOP-40 OIS Preparation - Operations Engineering Bulletins (OEB)*) .

L1 DISTRIBUTION

OEB are distributed to all affected Operators. It is the Operators responsibility to ensure the distribution of the OEB to all their applicable flight crews.

OEB1 Issue 3
RA HEIGHT DISTURBANCE WHEN OVERFLYING ANOTHER AIRCRAFT

Ident.: OEB-OEB1-OEB1-00021420.0001001 / 17 OCT 19

APPROVAL REFERENCE

APPROVED BY: Head of Airbus Flight Operations and Training Support
Approval date: 17 OCT 19
Approval reference: 20191017

- This OEB covers a significant operational issue. Non-compliance with this OEB may have a significant impact on the operations of the aircraft. Airbus recommends that the operators apply this OEB within 30 days from the date of issue of this OEB.
- Airbus recommends that all operators rapidly incorporate the corrective Service Bulletins that cancel this OEB when they become available.

Reason for issue:	This OEB is issued to provide operational recommendations in the case of an erroneous RA height during an aircraft overfly.
Applicable to:	All A350 aircraft.
Cancelled by:	Future RA standard or FCGS standard.

Note: The interchangeability code, given in the Illustrated Part Catalog (IPC), indicates the conditions for interchangeability of equipment. After installation of corrective modification(s)/SB(s), if an Operator reinstalls any equipment affected by this OEB, it is the Operator's responsibility to ensure that the recommendations given in this OEB are applied again for the applicable aircraft.

Operations Engineering Bulletins are issued by Airbus, as the need arises, to quickly transmit technical and procedural information. They are distributed to all FCOM holders and to others who need advice of changes to operational information.
The information in the OEB is recommended by Airbus, but may not be approved by Airworthiness Authorities. If the procedures contained in this OEB differ from the procedures in the AFM, the AFM remains the reference.

RA HEIGHT DISTURBANCE WHEN OVERFLYING ANOTHER AIRCRAFT (Cont'd)

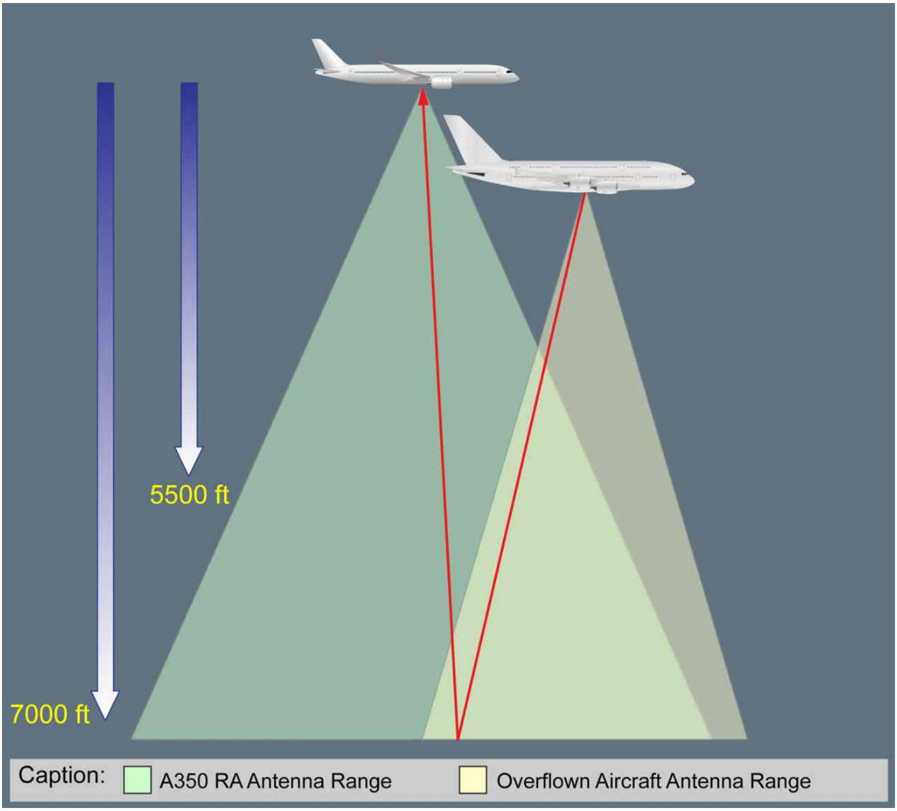
Ident.: OEB-OEB1-OEB1-00021421.0001001 / 17 OCT 19

DESCRIPTION

Above 7 000 ft AGL, when an A350 overflies another aircraft that is less than 5 500 ft below, the A350 RA (Radio Altimeter) signals may be disturbed due to the returns of the RA signals from the overflown aircraft.

Overfly Phase



5500 ft
7000 ft
Caption:
🟩 A350 RA Antenna Range
🟨 Overflown Aircraft Antenna Range

- **During the overfly:**
  The RA indication fluctuates within its operational range.

Continued on the following page

RA HEIGHT DISTURBANCE WHEN OVERFLYING ANOTHER AIRCRAFT (Cont'd)

As a consequence, depending on the RA height indication, some of the following cockpit effects may be triggered:

- Spurious L/G GEAR NOT DOWN ECAM alert
- Spurious altitude auto callouts
- Spurious TAWS aural alerts
- Reversion of the TCAS mode to TA ONLY mode associated with the inhibition of "TRAFFIC TRAFFIC" aural alert
- Inhibition of the AP/FD TCAS function with AUTO FLT TCAS MODE FAULT ECAM alert
- Temporary loss of the BTV function associated with the BRAKES BTV FAULT ECAM alert
- Temporary loss of the ROW/ROP function associated with the SURV ROW / ROP LOST ECAM alert
- Temporary loss the Autoland capability associated with the AUTO FLT APPROACH CAPABILITY DOWNGRADED ECAM alert
- Temporary loss of the reactive windshear detection associated with the SURV REACTIVE W/S DET FAULT ECAM alert.

● **After the overfly and above 5 500 ft AGL :**

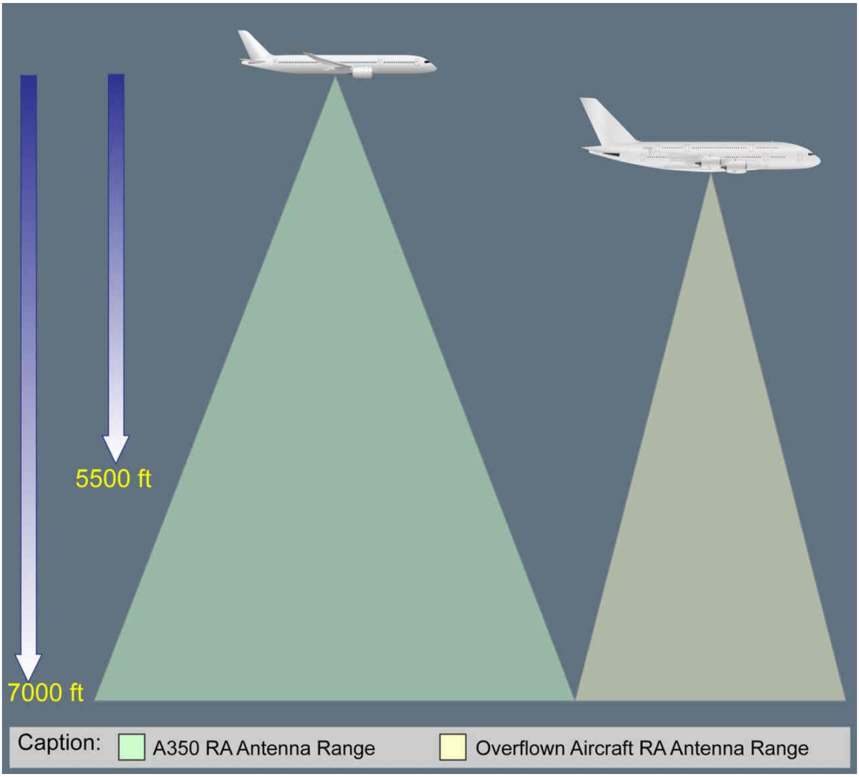
When the RA antenna of the overflown aircraft is out of the A350 RA antenna range, the RA indication disappears.

Normal behaviors of the ECAM alerts, auto callouts and TCAS Traffic Advisory / Resolution Advisory mode is recovered.

Continued on the following page

RA HEIGHT DISTURBANCE WHEN OVERFLYING ANOTHER AIRCRAFT (Cont'd)

After Overfly Phase



5500 ft
7000 ft
Caption:
🟩 A350 RA Antenna Range
🟨 Overflown Aircraft RA Antenna Range

However, after such event, RA are rejected by the PRIMs.
As a consequence, the following cockpit effects are triggered until the A350 descends below 5 500 ft AGL:

- Inhibition of the AP/FD TCAS function with AUTO FLT TCAS MODE FAULT ECAM alert
- Temporary loss of the ROW/ROP function associated with the SURV ROW / ROP LOST ECAM alert

Continued on the following page

RA HEIGHT DISTURBANCE WHEN OVERFLYING ANOTHER AIRCRAFT (Cont'd)

- Temporary loss the Autoland capability associated with the AUTO FLT APPROACH CAPABILITY DOWNGRADED ECAM alert
- Temporary loss of the reactive windshear detection associated with the SURV REACTIVE W/S DET FAULT ECAM alert.

● **Below 5 500 ft AGL:**
Normal operation of the RA is recovered.
Normal behavior of the all ECAM alerts, landing capability and guidance mode is recovered.

PROCEDURE

● **During the overfly:**
Above 7 000 ft AGL, if the flight crew observes some of the above behaviors when overflying an aircraft with fluctuations of the RA height indication, the flight crew may suspect that the alerts and auto callouts are spurious.
Therefore, the flight crew may disregard the aural alerts and auto callouts, and clear or cancel the ECAM alerts.
In addition, the flight crew must carefully monitor traffics on the ND for possible threats, since TCAS may revert to TA ONLY without aural alert, until the Traffic Advisory / Resolution Advisory mode is recovered (TA ONLY message disappears on ND).

● **After the overfly:**
The following cockpit effects remain triggered until the aircraft descends below 5 500 ft AGL:

- Inhibition of the AP/FD TCAS function with AUTO FLT TCAS MODE FAULT ECAM alert
- Temporary loss of the ROW/ROP function associated with the SURV ROW / ROP LOST ECAM alert
- Temporary loss the Autoland capability associated with the AUTO FLT APPROACH CAPABILITY DOWNGRADED ECAM alert
- Temporary loss of the reactive windshear detection associated with the SURV REACTIVE W/S DET FAULT ECAM alert.

● **For approach:**
Unless other failure that affects the approach capability occurred during the flight, the aircraft will retrieve its normal approach capability below 5 500 ft AGL.
In order to retrieve the correct approach capability, the flight crew should wait below 5 500 ft AGL to press the AFS CP APPR pushbutton to arm the approach.

Continued on the following page

RA HEIGHT DISTURBANCE WHEN OVERFLYING ANOTHER AIRCRAFT (Cont'd)

Note:

1. Above 5 500 ft AGL, If the flight crew press the APPR pushbutton to arm the approach, the approach capability displayed on the FMA will remain APPR1 with no update.
In order to retrieve the correct approach capability, the flight crew should pull the V/S knob to disengage the approach and wait below 5 500 ft AGL to press the APPR pushbutton to arm the approach again.

2. Above 5 500 ft AGL, the flight crew could press the LOC pushbutton to arm lateral guidance.

Continued on the following page

AFS CP ALTITUDE KNOB USE (Cont'd)

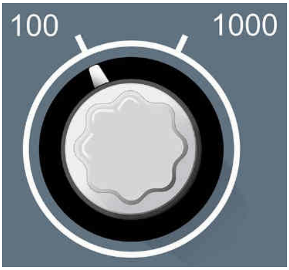
Ident.: OEB-OEB8-OEB8-00025232.0001001 / 04 SEP 19

EXPLANATION

Operators reported some events of not commanded AFS CP altitude change.
Investigations indicates that internal mechanical components of the AFS CP ALT Knob might have sensitivity weakness.



The ALT Knob is made of:
- An outer knob that has two positions: 100 and 1000, to set the target altitude in increments of 100 ft or 1 000 ft.
- A button that the flight crew can turn, push and pull to define a new target altitude, and use the managed or selected mode.

The possible sensitivity weakness could lead to an offset of only one increment of not commanded altitude change, i.e.(100 ft or 1 000 ft depending on the outer knob setting.
As a result, in order to limit the possible not commanded altitude change, a new procedure is introduced.
Flight crew should set the outer knob of the AFS CP ALT knob to the 100 position after each use.

AFS CP ALTITUDE KNOB USE- PROC - BULLETIN

Ident.: OEB-OEB8-OEB8-00025233.0001001 / 04 SEP 19

PROCEDURE

- **After each use of the AFS CP ALT knob:**

  ALT outer knob..SET 100

L2 *The 1000 position of the ALT outer knob can be used for altitude target selection. However, the flight crew should ensure that the ALT outer knob is set to the 100 position after each use.*

NOT COMMANDED ENGINE SHUTDOWN DUE TO LIQUID SPILLAGE ON THE CENTER PEDESTAL - UPDATED PROCEDURE V3 (Cont'd)

Ident.: OEB-OEB9-OEB9-00025401.0001001 / 09 APR 20

2

EXPLANATION

Operators reported few events of not commanded In Flight Shut Down (IFSD) a few minutes after inadvertent liquid spillage on the ENG START panel or ECAM Control Panel (ECP) of the pedestal. Several engine relight attempts were not successful.
Investigations indicate an abnormal operation of the components of the ENG START panel.
As a result, a protective cover is introduced in order to protect the ENG START panel and ECAM Control Panel.
When the protective cover is installed on the ENG START panel and ECAM Control Panel, the flight crew can access to the SD Page pushbuttons without the removal of the cover (e.g. periodic check of the SD pages).
In order to interact with the other controls of the ENG START panel and ECAM Control Panel, the flight crew must remove the protective cover (e.g. handling of ECAM procedure...).
Precautionary procedures are introduced in addition to standard practices for the handling of liquids in the cockpit as commonly applied by Operators.
During the preliminary cockpit preparation, the flight crew must advise the cabin crew about the standard practices for the handling of liquids in the cockpit. Flight and cabin crews must respect the following liquid prohibited zone:

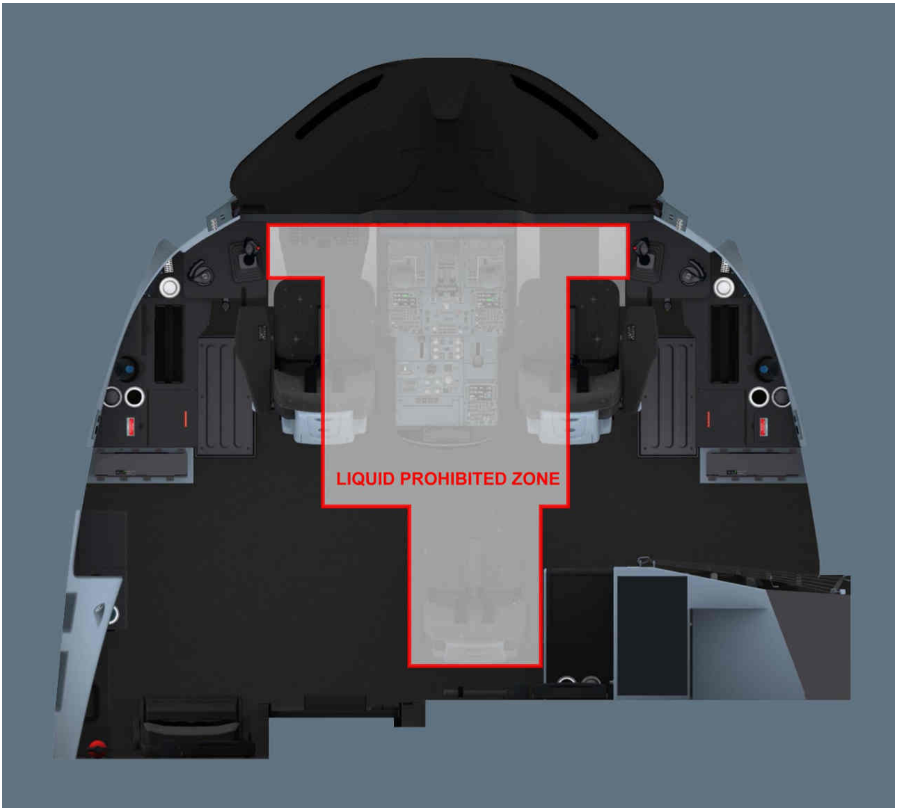
- Center pedestal
- Sliding tables of CM1 and CM2
- Inboard sides of CM1 and CM2 seats
- Third occupant seat.

However, a crewmember can cross the liquid prohibited zone in order to provide beverage to the CM2. In this case:

- Before beverage delivery, the flight crew should ensure that the cover is installed on the ENG START panel and ECAM Control Panel
- The crewmember passes in front of the third occupant seat, and behind the CM2 seat to deliver the beverage via the right lateral console.

Continued on the following page

NOT COMMANDED ENGINE SHUTDOWN DUE TO LIQUID SPILLAGE ON THE CENTER PEDESTAL - UPDATED PROCEDURE V3 (Cont'd)



In flight, the flight crew should:

- Consider landing at the nearest suitable airport (LAND ANSA), in the case of inadvertent liquid spillage on ENG START panel or on ECAM Control Panel
- Land as soon as possible (LAND ASAP) at the nearest airport at which a safe landing can be made, in the case of inadvertent liquid spillage on ENG START panel or on ECAM Control Panel, and one engine shutdown.

Continued on the following page

NOT COMMANDED ENGINE SHUTDOWN DUE TO LIQUID SPILLAGE ON THE CENTER PEDESTAL - UPDATED PROCEDURE V3 (Cont'd)

In the case of liquid spillage on the pedestal, the flight crew must report the event in the logbook after landing. A maintenance action is required.

NOT COMMANDED ENGINE SHUTDOWN DUE TO LIQUID SPILLAGE ON THE CENTER PEDESTAL

3

PROCEDURES

PRELIMINARY COCKPIT PREPARATION

CABIN CREW..ADVISE

The flight crew must advise the cabin crew about the standard practices for the handling of liquids in the cockpit.

PROTECTIVE COVER..REMOVE

Remove with care the cover from the ENG START panel and ECAM Control Panel.

PROTECTIVE COVER..CHECK STATE AND STOW

Check if the cover is in a good state for operations (e.g. no hole, no tearing).
Stow with care the cover in one of the lateral consoles.

CLIMB - AT 10 000 FT

PROTECTIVE COVER..INSTALL

Install with care the cover on the ENG START panel and ECAM Control Panel, and ensure that the cover is correctly positioned and adjusted at each corner of the ENG START panel and ECAM Control Panel.
The flight crew can access to the SD Page pushbuttons without the removal of the cover.

DESCENT PREPARATION

PROTECTIVE COVER..REMOVE AND STOW

Remove with care the cover from the ENG START panel and ECAM Control Panel.
Stow with care the cover in one of the lateral consoles.

Continued on the following page

NOT COMMANDED ENGINE SHUTDOWN DUE TO LIQUID SPILLAGE ON THE CENTER PEDESTAL - UPDATED PROCEDURE V3 (Cont'd)

PARKING

- **When the PARKING procedure is completed:**

  PROTECTIVE COVER..INSTALL

  Install with care the cover on the ENG START panel and ECAM Control Panel, and ensure that the cover is correctly positioned and adjusted at each corner of the ENG START panel and ECAM Control Panel.

ABNORMAL AND EMERGENCY PROCEDURES

Handling of ECAM Procedures

- **In the case of ECAM management:**

  PROTECTIVE COVER..REMOVE AND STOW

  Remove with care the cover from the ENG START panel and ECAM Control Panel. Stow with care the cover in one of the lateral consoles.

- **When the ECAM management is completed:**

  PROTECTIVE COVER..INSTALL

  Install with care the cover on the ENG START panel and ECAM Control Panel, and ensure that the cover is correctly positioned and adjusted at each corner of the ENG START panel and ECAM Control Panel.

LIQUID SPILLAGE ON THE CENTER PEDESTAL

- **If the cover is removed or damaged, and in the case of inadvertent liquid spillage on ENG START panel or on ECAM Control Panel:**

  LAND ANSA
  DIVERSION..CONSIDER

  - **In the case of one engine shutdown:**

    LAND ASAP
    DIVERSION..INITIATE

- **In the case of inadvertent liquid spillage on the pedestal:**

  LOGBOOK..REPORT LIQUID SPILLAGE ON PEDESTAL

  Maintenance action is due.
